Some time ago, (seems like the beginning of time now but it was only a few years ago,) AtariUser was running a 'Join the Atari Revolution' campaign. Does anyone have the design of the logo used for the rubber stamps? Could you send me a GIF or IMP of the stamp?

Thanks

Does anybody know if someone is working on a Speccy emualtor for the Falcon030?

Could the inclusion of audio in/out make it possible to connect a standard tape deck to the Falcon and then load the games from cassete? (Then one could later save them to the HD) With the Falcon one should be able to speed the old games up a bit.

I know it's old, but some of the games are still fun. (IMHO)

Scott, I don't know if it would be of any use to you, but I have here
copies of software, along with circuit diagrams to build a link port for
an ethernet adaptor. The link circuit access's the parallel and cartridge
ports.

I use Gemram on my American TOS 2.06 MSTE. It works fine! I'd love
to try AES4 in singletasking but I don't have GEM.SYS...

AFAIK, ROMRAM ONLY works on machines with TT-RAM! That means Gemram
is really your only alternative for non-TTs...

I believe you mean Microsoft Write, and indeed it was horrible.

As for using MS Word, it is as simply as getting a Spectre 128 or GCR. My Spectre has opened up a lot of doors for me in terms of software (though I use ST programs for most things). IMHO, Mac capability is great when you need to do something fairly unusual (like the molecular biophysics programs a previous poster mentioned). Also, it gives one the ability to run "mainstream" applications easily (like MS Word, for example). I personally don't like MS Word all that much (I'm more of a TeX guy, I guess), but it is handy to have around.

Would this be the commercial version of Marcel Word?
Has this been released as shareware? Or is it just a demo?
I heard it should be pretty good, but I expected it wouldn't do very well
because it has so much competition from other wordprocessors like Multiwriter
and such.

Erlend.

Well said.

I'm here to learn more about my new Falcon - both in terms of programming, applications and even games. Not to read thousands of characters every single day about how much the latest macintosh computer may or may not cost. It's a waste of space - surely there's a general computer discussion newsgroup for this kind of thing.

This isn't censorship, it's just sensible.

BTW - I'm still looking for a 68000 assembler line drawing routine (any mode), so if anyone's got one can you send it to me? thanks.

Unfortunately not (to my knowledge), Brainstorm, or possibly Atari
themselves, will send you the information for a fee of somewhere around
US$ 100. An interesting project for a hacker there, me thinks.

I'd pay a shareware fee (and let's face it, that's what it'd be - if
not legally [g]) if it was a good game which kept my attention for more
than a couple of hours.

Most wanted - well StreetFighter 2 would be a good start [g], I'm quite
partial to platform games (although they bore a lot of people to tears)
but the one game I would *love* to see is an archon-clone, with much
better graphics and sound but maintaining the playability.

By the way, you can put me on record as being one person who will never again buy a copy-protected program. A couple experiences with early Roland sequencing software and with Lotus were enough. In the case of the Roland software, the program allowed me to "install" one copy on a HD, but in order to install it on another hard drive, I had to "uninstall" it from the first HD. When the hd crapped out, I had software that I could never again install on any HD. The utility to make backup floppies never worked right. Then the release disk crapped out, so I had no way of even playing the sequences I had created into another sequencer or otherwise retrieving them for use. And Roland didn't make the software any more, so they said, "Buzz off," or words to that effect. Won't bore you with the Lotus horror stories, except to say that I never permanently lost a spreadsheet, while I did permanently lose several sequences,

The upshot of it is, it's a hassle I don't need. For those of you who will put up with it, more power to you. But I have flexibility with CK and the rest of my program set that I just wouldn't have with a copy-protected

program, no matter how painless the scheme is supposed to be. I own all the software I use on a regular basis and a lot I don't, and I've never made a copy to give to a friend. Why should I be punished ahead of the fact as though I have.

Just my .02. BTW, a longstanding CK user, I've been looking forward to Cubase for Windows 2.0 because it is supposed to better integrate digital recording and sequencing for the PC. But if it comes with a copy-protection scheme attached, forget it......

My employer is not responsible for my opinions. I'm not altogether sure that I am!

>There was a discussion a while back about Cubase and if anyone has
>cracked it yet.
>Well, has anyone?
>Hardware protected software SUCKS.

Do you realize that everytime you copy or break a program that you are taking food out of the mouths of the families of programmers that make that program? How would you like it if I came to your house and took all of the food from your kitchen? That is EXACTLY what you are doing when you use a product that you didn't pay for.

So, do us all a favor.. please buy your software! Its the only way that good software will continue to get produced. Remember, without royalities from software, authors can't write programs and without programs you have nothing to do with your computer! So, by copying programs and cracking them, you are just hurting yourself.

If you are really capable of cracking programs, why not put that sort of knowledge to work for someone. Perhaps you have the knowledge to design protection schemes for software houses or something. Do something positive!

Whatever happened to the "Revolution"? I haven't gotten any info
from Artisan Software in awhile. I know that Donald Thomas still
works at Atari (or thought that he did). Personally, I think that
we should begin a letter writing campaign to ATARI, stating our
views. One thing that I would like to see is that if Atari is
not going to release any more computers (speculation) then they
should allow anyone to develop Atari clones. Why wouldn't it be
feasible for Atari dealers who have trouble getting Atari product
in their stores (I had to call all over the country for an STe)
to make their own systems. Tiny clone dealerships have popped up
all over; why not the same with Atari systems?
What do you say? Let's not sit by idle while Atari ignores us
in favor of the Jaguar!

>to be sure of supporting all Atari users around the world... all 500 of 'em. :)

But there is little or no difference between the different systems from a
programmers viewpoint. In fact, the only difference I know of is in the
scan rate. That's why games run faster on American TVs than on UK TVs (for
instance) and why some very time critical demos won't run on a system they
weren't written for.

For a standard game the programmer shouldn't give a damn about what TV
system it will run in.

NOT ME!!! I'd pay $60-$80 for a mediocre Falcon game and $120-$150 for a good one. This is not because I'm rich. (I'd probably only buy one game at that price.) Let's put it this way.... when I bought my Falcon, Trupaint was the ONLY Falcon program at my dealer. So I bought it. (I needed to have something run on my Falcon besides Landmine, and none of my ST stuff worked.) But my dealer still doesn't have a SINGLE arcade game for the Falcon. (There's one train simulation game, but I wouldn't call that arcade.)

As far as I'm concerned, the Falcon Game Market is at the state of Developer's Paradise: At this point I would pay big for ANY Falcon game I can get. Once I see maybe five games on the market, then I'll start thinking about price. :)

>
> It works, but you must kill all *.ACC at the root of your boot partition.

Only Atari can come up with something that silly. :-(

After following your advice (thank you) I encountered the next problem. I have a line 'setenv ACCPATH=C:\ACC,U:\USR\GEM\ACCS' in gem.cnf, but only the accs in c:\acc are started. At first I thought the problem might be with the symbolic link, so I copied the accs from u:\usr\gem\accs to c:\foo, and modified the ACCPATH variable accordingly; the problem remained the same. I swapped the paths (ACCPATH=C:\FOO,C:\ACC), and then only the accs in c:\foo were executed.

Unless I've been using the wrong syntax (of course Atari does not provide any real documentation, they never did and never will do :-( ), it seems like only the first path in ACCPATH is searched for accessories.

So what is it, a bug by me or a bug by Atari?

Do you mean to tell me that if I had simply waited one more year to buy my
Falcon that I could have avoided my 1600 mile drive to pick one up? Well,
I guess their policies aren't that bad after all. :)

Although, I have to admit, at the time Bob Brodie explained to me how the
no-mail policy would vastly increase the Atari dealer community and I would
soon see dealers near me!

But no one showed up. :(

So maybe we need to make it illegal to sell Falcons through the mail just a
little bit longer. :)

>
> Does anybody know of a CD-ROM containing PD/Shareware files for ATARI st
> range of computers

The recently released GEMini Atari CD-ROM is a great deal.

The best thing for me was the MASSIVE number of CALAMUS CFN FONTS.

Really nice ones too.

I finally got to look at all the myriad of dinky little games and utilities,
and desk accessories.

Sure, there are heaps of junky programs on it, but that's the case with
every `collection' style CD-ROM.

But with 600000000 bytes to roam through, I'm sure you can find $50
worth. (actually, probably on 400000000, since it's also got all the
files in compressed form - great for BBS owners).

Thinking about getting a CDROM drive, but worried about software?

Don't be. In addition to the GEMini CD-ROM, you can make use of the
huge number of CD-ROMs available containing generic data such as clipart
and GIF image files. I bought a clipart disc with 11,000 images (50%
of which are utter garbage or repeats, but that's still 5000 images!).

And for SF fans, there is the Hugo/Nebula Awards CD-ROM, with 5 novels
and all the short stories nominated for the awards. $30 for that one,
I think. All files in both ASCII and RTF format.

And what about PhotoCD - your CD-ROM drive becomes a slide projector.

And the best thing about CD-ROMs is that you can (will) get a SCSI
drive which you can use on just about any machine that lurks in
your future.

Oh, and you can play audio CD's on most CD-ROM drives - so there's
another excuse.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well, I have yet to see anyone mention it . . .

Lharc 2.99 was recently uploaded to atari.archive.umich.edu and other sites.
It is great! The big upgrade over 2.32 is the inclusion of a GEM shell
similar to ST Zip's (it has lots more options though). I particularly
like the estimates of compression/decompression time, and the bar graph
style progress display. The shell is installable as an application. This
appears to be a must-have program.

Oh, the only weird thing was that this new version is contained in a
Zip file?!?

3635. Re: Falcon030 Goes Mail-Order!

Newsgroup: comp.sys.atari.st
Date: 1994-02-23 06:13:06 UTC
From: Gordie Meyer ATARI UNITED cofounder <biblinski@delphi.com>
Message-ID: <Zq+LmzS.biblinski@delphi.com>
Source record: 192342

Steve Johnson <steve-j@teleport.com> writes:

>For what it's worth, Atari Corp. has lifted the 'NO MAIL ORDER'
>restriction for dealers carrying the Falcon030, so they are now

According to Bob Brodie, there is a new addendum to the dealer agreement that allows them the option of selling Falcons by mail order, with the provision that they may only use list prices in any ads they run. Dealers must sign on for this, however, and agree to the advertised price restriction before they can go mail order.

Realizing that over 75% of all computers sold today are sold via mail order, Atari decided it would serve the consumer better if the Falcon030 was available that way, too. Essentially, the new addendum removes the requirement that a dealer get clearance to sell to a customer who doesn't actually visit their store. Whether this move will increase the numbers of dealers, or just help boost the sales of the existing dealers is yet to be seen. But, it does make it easier to buy a Falcon here in North America.

3638. Looking for a couple packages for MiNT

Newsgroup: comp.sys.atari.st
Date: 1994-02-23 08:28:17 UTC
From: mmiller@nyx10.cs.du.edu
Message-ID: <9402230826.AA09879@nyx10.cs.du.edu>
Source record: 192345

Ah! Nice to be back in the Atari forum, at least for a bit. I am an Atari owner, but ironicly I haven't been paying attention to what's going on in this group in the past year.

A while ago I set up MiNT 0.95 PL 13 (I believe), and have gradually been working the bugs out of my setup. sjg@phlem.ph.kcl.ac.uk (the author of MDK) has been a great help in working these things out. I have a Mega 2 STe with TOS 2.05.

There are two things I'm looking for: A good and easy to use (if possible) uucp package that will run under MiNT, and some kind of ul/dl protocol program I can run under MiNT, so I can do x-modem, y-modem, or preferably z-modem transfers in the background while I'm doing something else.

While XYZ.TTP will run nicely under MiNT, it demands that it get ALL the remaining memory, or it refuses to run. I can't even use "limit" with it.

I've gotten the doc's for "term", out of Mint/Tos/Network at atari.archive and while it looks like I would be able to do what I want with it, I am not even sure from the doc's if I can get it to work or not, if it will be too much trouble to set up properly to be worth it. The reason being that the doc's are quite technical, describing what it can and can't do, speaking in Unix networking terms, which I am unfamiliar with. Don't get me wrong, I am technically competent in many computing areas, but I could tell the doc's were not written for my kind of audience. Has anyone set this up successfully and what can you do with "term"? I wasn't really able to determine that from the doc's, except it's supposed to be a substitute for implementing slip.

I've downloaded a uucp package from the Mint/Tos/Utilities dir. at atari.archive, called "tuu103_3.zoo". It's quite large, and lo and behold when I look at the documentation I see stuff like this in the documentation which makes me wonder if I should even bother to install it: "This is at best a beta version, so don't expect it to work :)" This may be a light-hearted joke, but I was getting the impression that this was "merely a port" and there was no checking to see if it would work with anybody's but the porter's setup. This did not give me confidence, since I'm new to the uucp world. I would like to know if others have tried tuu under MiNT and have been happy with it, or if they've used something else under MiNT that's better.

While I will try to pay attention to this group for replies, please try to reply to my e-mail address (in my .sig below), since I usually

do not read this group anymore.

Thanks,

---Mark

A few Facts Afir, the Atari market it mostly ST/STE and then mainly Games,
would you not aggree...

Most people I thing would play games on a Colour monitor..??

Tell me how would you run a Terminal program then on a ST/STE with a Colour
Monitor..???

So my statements in running a Terminal program in Med Res still stands, there
are 3 program that I would rate in this mode, Fash 1.6, The Storm, Trapido,
there are others like FZT, No VT100 or Auto Zmodem, but I think that is for
little Boys...

There are otheres like Interlink (Very Slow), no Auto Zmodem, Stalker 3,
no good in Med Res, Teddy Term, no VT100 Support or Auto Zmodem, Flash II
did not support Omens V4.7 Zmodem...

So Far the STORM rates some 200% to me, it supports Auto Zmodem and on the
VAX/VMS system here and works with Omens V4.7 Zmodem, and it does Background
Zmodem with out using a MultiTos etc, and NOTE as a Program...???

Food for thought don't you think......??

: > Brainstorm's fast decoding!
: >

: How does one write a program to use the decoder, is the some documentation
: somewhere?

: Tom.

The Brainstorm DSP JPEG decoder is a TSR, which installs a cookie. Following the cookie magic, there is a pointer to a list a functions (OpenDriver, CloseDriver, GetImageInformation, DecodeImage, ...). A programmer using it doesn't have to call the DSP directly. He just have to load the JPEG image, specify some parameters, and just say 'decode' (in 8, 16, 24, or 32 bits/pixel). This means that ANY program (GEM/TOS) can use it.

About the availability of all this information:
You have to pay about 100 US$ to ATARI (not us), and then we can send you all the information, with some sample code.
After paying this licence, you can use the decoder in any of your applications, and distribute it with your programs.
Anybody interested in adding 'fast JPEG decoding' capabilities to a program should contact Wilfried Kilwinger (Atari Europe?), or directly Bill Rehbock (Atari Corp.).
Note that this kind of distribution (100US$ licence) was not my choice. Atari Corp. decided it. I'm not receiving money at all, when you pay the 100US$ licence to Atari Corp.

Raphael Lemoine(Brainstorm).

You are correct. With a 1MB 1040STfm, Notator Logic would load and
the demo would start nicely. However, you can't do anything else
with it because you run out of memory! You can't even close the
demo file! Looks like to get it to work properly, you need to get
a 4MB Falcon or something.

The chip is located behind the two OS-ROMs. It has 40 pins and on the
motherboard you find the number "U300". The chip has the number
CO25913-38 / PH23-030.

Ciao, Arno

Computes Tech guide 2 - AES is good but dated.
There is also a series of tutorials called professional Gem by Tim Orn. These are PD text files with source code examples. Should be on most FTP sites as progem or similar.
A book on PC GEM will help if all else fails.
The Atari Compendium is said to be very good. I haven't read it myself though.

3648. Zmodem Support

Newsgroup: comp.sys.atari.st
Date: 1994-02-23 10:23:12 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <2kfaqg$fdj@golem.wcc.govt.nz>
Source record: 192455
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well this is a report of Terminal programs that have built in Auto Zmodem
and if they work with Omens Complimentary version of Zmodem 4.7 dated 29-11-93,
that is on this VAX/VMS Sytem here....

This Zmodem only works with built in Auto Zmodems, so FZT is out plus a few
others.....

The Programs tested were FLASH 2.2, THE STORM 1.02, STALKER 3.02 and
CONNECT 245E..

A small 10k Zip file was used for all the tests, the first test was to see if
they all worked with the Older Zmodem that is on here 1987, but don't have the
version number at present...

All dnloded that file OK...

I then selected the Later Zmodem V4.7 Dated 29-11-93, all but one failed
to dnload that files and gave timeouts, this was done after testing the 1987
version and deleting the dnloaded file at my end, each time..

The only one to work 100%, each time was THE STORM 1.02..???

So don't we have any Real Comms Programers out there...:-)....????

I don't know if its posible to test GSZRZ 3.4 in ay way, if any one has a way
please let me know.....

NOTE: A lot of people that use this Public Site have had lots of problems with
this New Zmodem, These are PC Clones user I might add, but it does work with
Omen products on PC Clones....

>could be MiNT!).
I called Gribnif, and one requires v3.03 for the Falcon. I bought this yesterday, and it works OK. Shame it does its own window stuff (scroll bars and the suchlike), so doesn't use the 3D effects like other programs. Perhaps more importantly, no support for colour icons, either.

>One bug -- it cannot delete directories, because it calls Ddelete()
>with a pathname with a trailing '\', which has always been illegal,
>but always tolerated. Until TOS 4...
Aha! I had trouble deleting directories last night, and had to exit to TOS to do it! Now you mention the specifics, I remember seeing a patch program in the Programmer's Forum in ST Applications some time ago. Hope I've still got that issue.

Yep I'll back that, the Atari Developers Docs for the Falcon say the same thing as does the Atari Compendium and that HiSoft MASS book. I think this is Atari's doing as I'm sure I read in my motorola 56001 manual that the DSP has seperate on and off chip memory spaces for Program,X data and Y data...

anyway who cares, the DSP is still a great little chip!

3655. Re: Cubase on the Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-02-23 11:59:32 UTC
From: djs@jet.uk
Message-ID: <1994Feb23.115932.21665@jet.uk>
Source record: 192462
Cross-posted to: comp.music,comp.sys.atari.st

My problems with the Cubase dongle are solved. The reason that it wouldn't fit seems to be because the socket was not totally flush with the circuit board, so the gap required between the socket and the board/shielding below it was increased. The complete fix would have been to take my Falcon back and get the socket sorted, but I opted for the easier, quicker option of cutting the dongle casing.

Then, of course, the software problems started! If I hit one of the keypad parenthses (for Fast Forward or Fast Rewind), it (re)winds for ever, and pressing space won't stop it! Harman Audio (081 207 5050) state that 3.02 is the required version, and I have 3.01, so they are sending an update.

I have seen people saying they wanted to try the new AES (4.0+) with their machines. They say they have "gem.sys" or something like that. Where did you get this? I use GEMRAM when I use WINIX and wouldn't mind trying the new AES either. How do you get the new GEM.SYS file.

For that matter, I heard that anyone can get the cheesy programs that came with the FALCON (Mines, SAM, etc. but not Multitos & Atariworks, of course). Where are those programs as well, or does one have to get those from Atari and pay the price?

If it's a reasonably well-written program, then you could
probably get away with running it under a Monochrome emulator (and
thus saving the expense of another monitor). Take a look at SEBRA -
it should be available on your favorite FTP site, and is probably
the best monochrome emulator out there (I have no need for it presently,
as I have a multisync, but did check it out at one time). Let
us know if Cbzone works under it...

The Compendium is good, but is not a tutorial on programming GEM. A book (the only book?) on PC GEM is called "Programming in GEM", pub Sybex, by Balma and Fitler (sp?), and unfortunately out of print.

I concur with the recommendation for Tim Oren's ProGEM guide. It is in atari.archive.

If it's truly GEM, there's good chances that it works either with
Autoswitch Overscan (commercial SM124 emulator for TT high) or
with VGA_SIMU (shareware program that emulates all five screen
modes available with a VGA display on a TT). Autoswitch Overscan
is available from Overscan GbR (I think), VGA_SIMU should be
available via ftp from the usual sites.

:>and off chip memory spaces for Program,X data and Y data...
:>
:>anyway who cares, the DSP is still a great little chip!
:>
>Ian Rae

Yup, I was completely wrong about the DSP memory, I originally tested the
amount of memory by writing to memory and seeing which memory address where
valid to write to, the Atari arrangement of memory fooled this test!
Logically the DSP thinks it has X,Y,P memory however PHYSICALLY these address
spaces occupy the same RAM chips.

Would someone care to explain how the on-chip RAM fits into all this?
From the DSP manual I get the following.

256 words of X,Y (on-chip)
512 words of P memory.

I assume for the moment that the 'physical mapping' only occurs after
these addresses?

Griff
--

PS. Its an absolute miracle that I got away with not knowing this ;-)
it does however help to explain some of the recent bugs in my DSP stuff
though !!

3669. Re: Minix or Mint on atari TT030 is it possible?

>I have been speaking to my local modem supplier (probably a bad move ;))
>The discussion turned to the 'new' 28.8 speeds that will be arriving soon
>and the DTE speeds supported by these modems (~112000??).

There are some board's, hardware extensions and other things available:
1. RSVE --> 38400, 57600, and 115200 bps for the standard MFP chip.
for the 115200 the ST should be really accelerated. TT's will handle it.
2. ESCC --> enhanced SCC chip board fot ST.

BTW: Mega STE and TT can handel these speeds on the SCC based ports.
Falcon's on the standard port.

>Maybe a driver using HS Modular could provide the hooks??
yes. ask HS about that.

>
>I am an avid Neodesk user, and I can state that if you use Neodesk there is
>very little difference between TOS 1.2 _with some patches_ and TOS 1.4

Really? I seem to recall noticeable improvement in disk access speed and
overall system reliability when I went from 1.0 to 1.4. I've always been
under the impression that 1.2 was VERY much like 1.0... bugs and all.

>Instead, I would put the ~$50 toward NVDI (~$90) or Warp9 (~$40). Already got
>one of those? Then I would put it toward Neodesk (~$50). Already got that?
>Then I would put it toward Diamond Edge (~$50). Already got that? Then I
>would put it toward Geneva (~$60)......

Well, the software items you mentioned are definitely worth considering, I have
no arguement there (even though I am NOT a big Neodesk fan). However, all those
things work better when you give them the improved foundation of a better TOS.

>In other words, there are a whole slew of things that would enhance your
>productivity more than a wimpy TOS 1.4 upgrade. The one feature that TOS 1.4
>has that is IMHO arguably worth the $50 is the 32mb "normal" partition size.

Amen to that! I don't consider TOS 1.4 a 'wimpy' upgrade, although with the
advent of TOS 2.06, it is most certainly out-of-date (as is 1.0, 1.2, 1.62, etc).

Then again, if an individual is happy with his/her system as it is, why mess
with it at all? In that case, NVDI or Warp9 gets my vote as first choice.

Just for the record, I've had my share of horror stories with copy
protection schemes too. Don't get me started on Dr. T's. However my
personal experience with the dongle protection on Cubase Score for the
PC is that it is non-intrusive. Don't let the dongle keep you from
buying Cubase.

Yes it would be *very* *very* fast too - the parallel architecture is
well suited to processor emulation. (i.e. you could 'fetch' the next
instruction at the current 'PC' in parallel etc).

There would not be enough DSP memory to emulate a 128k Spectrum though :(!!

Source record: 192490

I must say, Marcel is a VERY welcome addition to the ST shareware world!

I just doenloaded it yesterday and I already feel very comfortable with it! It's a great WP package. In fact, I believe it is the only english WP package available as shareware! I have been trying to find one for a while now. I downloaded the emacses (mg2a, uemacs, jove), the vis, the super-editors (tempus, everest, qed) but none really did the job as a word processor... I've now deleted all of them (except jove) in favor of marcel!

I plan to register it as the shareware fee is VERY reasonable (just US$10!) for such a great program.

I urge everyone else to give it a try and register it!

I use STalker all the time for telecommunications, and I only have a color monitor for my ST. If you run STalker as a program, full size the terminal window, and turn off the scroll bars, you do get an 80 column, 23 line screen in medium resolution, with the standard system font.

24 lines would be nice sometimes, but if it made that big a difference, I could switch to a shorter font and fit 24 or more lines. Personally, I think the advantages of a full GEM windowed terminal program that multitasks well and the speed of using the system font over a GDOS or custom font outweigh the 24th line, which rarely matters. STalker's Zmodem also works fine with the Omen Zmodem on both the Ultrix and VMS machines here at UMass.

] are 3 program that I would rate in this mode, Fash 1.6, The Storm, Trapido,
] there are others like FZT, No VT100 or Auto Zmodem, but I think that is for
] little Boys...

Auto-ZModem is not a protocol or standard, it is the program looking for
a series of characters telling it to start sending/receiving.

In FDT's case, it is **[Control Char' #24]B00 to receive, (FDT can even
tell you the ASCII codes for all the characters... :)

This is what most programs with 'Autostart Zmodem' use.

For smegs sake people, a comms program is a pile of bytes, if you like it
use it, if not, don't!

> I believe that Commodore's Ad campaign will be lower key in the U.S.
>but this won't be due to C= not knowing how to market machines , it'll be
>due to lack of financial resources . (money...something Atari don't have much
>of either) . However the money they are making will probably partially go
>towards advertising in the U.S (not just in AC and Amiga World)
> At first the U.S Amiga mags will be the only place it is advertised

A few game mags have reviewed it in the US too. Most were good too,
saying tings like "Let's just take a minute and say 'Wow!'" about the
games & stuff. One mag was really impressed with a game that runs on the
CDTV, just think of what they'll say when Akiko games come out, or ones
that use the MPEG module... "NEARLY as powerful as 3d0 for 1/2 the
price" etc. And it looks like 3d0 is going down fast so there's less
real competition. The mag reviews are more important than ads anyway. If
you have a great product but get a bad review, no sales... Bad prods w/
good reviews get good sales. So C= can get by with little advertising
here if the reviews keep up. Some mags even have CD32 sections now! In
the US! Yea, a great Sega style ad campaign would be great, but people
at least know something about it. I know some guys who don't like Amigas
but are impressed with CD32. Cool!

Hi all,
I am using the Photo Chrome 3 or however it is spelled? :)!
Anyway, When I run the PCSviewer program. it access drive A:
then returns to the desktop. So, I then tried the APP program
to view them. When I double click on the picture files it loads
the APP and displays the picture and it looks great! But,
It displays it until I reboot! Is there a way to display these
pictures without rebooting in between every picture?

I am using a 1040st, 1Meg, 130Meg Maxtor Drive, and Color or Mono.

Any help would be appreciated.

Thanks

Some one has cut up a message, not from me were it states that Atari OZZ has closed down..

This was not my message, my message was about CBM OZZ had closed down, Atari OZZ made a profit last year...

Amiga's don't sell to well in OZZ but they have better sales here so CBM NZ is still going...

So please chaps don't quote me in messages that I have never posted....

> protection schemes for software houses or something. Do something
> positive!

Copying or breaking (cracking) a program does not mean it is taking
the food out of the programmers kitchen! Many legitimate owners of
software are annoyed by the software package's protection scheme. While
I agree that we should all buy our software, I personally find software
protection schemes to be a nuisance, and will 'crack' any software package
that I opwn if I can.
As far as doing something positive, I don't find designing protection
schemes to be very postive. What a waste of programming expertise; it would
be better to focus ones energy in bettering the product, rather than
using time and expense to design a better 'cracker proof' scheme.

BTW, most MSDOS programs (yes, even games) have dropped protection
alltogether and have not noticed a drop in revenue. What revenue is lost
is made up in happy repeat customers.

In a nutshell, software with any protection SUCKS in my opinion.

Pure and utter bollox again Jim ... reminds me about that 'there are no Atari
BBS's (running Atari's for the BBS server)' thing a while back ....

Atari is alive in OZ, they operate out of Sydney, and are alive and well.
About 3 weeks ago I called up because they were having a clearance sale, and
the guy who I spoke to had recently moved from Commodore .... :^)

The Jag is to be released about June 94 I think.... Atari are just waiting on
stock to start selling .....

Sorry about this - a bit of an oversight on my part.

I don't think a colour verison (320x200) is really worth doing as it would have only 1/16 the number of pixels to play with compared to the X-Windows version. However it *is* quite possible to do, and I would be prepared to have a go if people are really interested. A combination version is out of the question though, as all the extra checks for resolution would slow it down far to much.

:-)

3704. Pure C hassles

Newsgroup: comp.sys.atari.st
Date: 1994-02-24 02:33:37 UTC
From: ktessner@isle.waterloo-rdp.on.ca
Message-ID: <1994Feb24.023337.2219@isle.waterloo-rdp.on.ca>
Source record: 192211

I am using Pure C (version Sep 20 1991) as my assembly language developement environment and have run into a snag, namely "Fatal: Internal Error: C1051". Does anyone have any clue what this means, and how I can get rid of it to finish my code? The one slightly strange thing I am doing in this code is using non-reentrant local variables by defining a BSS area after the name label of a subroutine, then naming the variables with '.' labels. ie:

```
Thissub: BSS
.local1: ds.w 1
.local2: ds.w 2
TEXT
move #5,.local1
bsr etcetera
rts
```

This assembled fine for awhile, but now that the file has gotten rather largish, this error has shown up. That's my suspected cause, but its so handy that I'd hate to abondon it. If anyone knows what C1051 really comes from, I'd love to know.

Another note. Are there newer, and even niftier, english versions of Pure C kicking around that can be purchased? There are no dealers in this area, and no mail order lists I've seen that offer Pure C. I'd really like to have a purchased, supported version of it, even if it is a German one that I can't comprehend.

Yes! I'm one of those weirdos that loves the Atari keyboard (well, I
hate those stupid function keys, but the rest is really nice); I just
wish my 1040 had some more raw POWER, and some more RAM. Usually it
works nicely though... especially since I do 99% of my compiling these
days on a _very_ fast NCR (make that "AT&T Global Information Solutions)
UNIX box.

Oh, and I slag all the computers I have to use... :-)

> Don't forget - the Jag's chipset was built IN-HOUSE so they're not
> paying others for the chips. Buying Power-PC's they'd have to pay enough
> for the makers to make a profit, thus driving up the prices.
> Either way, I'd love to see it though!

IBM/Motorola are selling the PPC chips _cheap_, much cheaper than the
Pentium... I've heard people saying the i486dx2/66 won't even be
price-competitive with the PowerPC chips by the end of '94!

This is something _very_ new, and MANY people thing the companies in on
the ground floor with this are going to be very successful.

Then again, Atari can screw up almost anything... :-\ AND they'd have
to come up with a _reason_ for people to buy an Atari box instead of a
Mac or IBM or <insert clone maker here> system. They won't be able to
do it if they go for the "cheaper" route like they've been trying to
since c.1985 (it worked then, but it won't now).

Why should I need to set UNIXMODE to anything while I'm running on a
minixfs partition under MiNT? The MicroEMACS I compiled (with the
MiNTlibs) doesn't truncate my filenames on me...

> I have professional GEM and the Atari compendium at the moment.

Maybe Warwick will post a GEM "hello world" in C++; it's probably about
five lines.

C++ is much better suited to writing GEM applications than C.

C++ es mui macho! :-)

I have been using it for the last few weeks and the user interface is very
good. However, I found that it doesn't like to compress very large files,
or a large number of smaller files. It simply aborts halfway.

I have been speaking to my local modem supplier (probably a bad move ;))

The discussion turned to the 'new' 28.8 speeds that will be arriving soon
and the DTE speeds supported by these modems (~112000??).

So i started thinking which would be the way to go to handle these kind
of speeds. I am aware of some development towards an ethernet adaptor that
plugs into the ACSI port.. is anyone working on a comms board??

Maybe a driver using HS Modular could provide the hooks??

*Note: I am not a programmer (yet.. anyone good at teaching C??)

>yet...

Do whatever you have to do to get it into your main directory on your
account that you're using FTP from. (either upload it if you're on
via modem, or copy if off a floppy if you're local)

FTP to the site, change to the correct directory for incoming stuff,
change to binary mode if needed, then use put <filename> instead of get

It's basically the reverse of what you do to receive a file.

It wasn't yet available on a.a.u.e. when I last checked, but it can be
downloaded from ftp.uni-kl.de in the incoming directory.

As for BlowUp, well, sorry, but the program is resolution dependent, and
it forces ST-low. I did make the effort to make sure it would run correctly
on the Falcon, though, so I hope you at least take a look at it...

Pardon? All you've got to do is to use the appropriate VDI system call to find out what the current resolution is. This will take only a few microseconds at the beginning of the program.

The use of VDI functions is the only way to handle all possible resolutions correctly, especially odd ones like those offered by OverScan and the like.

If you're not sure about how to take advantage of VDI, I'm going to look it up for you.

By the way, I cannot imagine that the XWindows version is restricted to a single res, or is it?

One megabit types, either 1M*8 or 1M*9 - whichever you can get cheaper. 120ns
is fast enough for the ST(E), down to 70ns should be no problem. Faster RAMs
could cause problems. If possible, avoid mixing RAMs from different
manufacturers in one memory bank.

Funny, I thought the DSP executed instructions in 2 clock cycles, so
3*32/2 = 48 MIPS. At least, that's what it says in the DSP User manual.

True. But there are several stand-alone patches available.

If your "Semper" does not work without BMAPFIX2 on your FALCON, it is
a silly program, because then it tries to open the nonexistant BIOS
channel #6 without testing for the FALCON hardware.

>internal Hard Drive....
Not really! This thread started when I asked some questions a few weeks
ago. Since then, I bought the Falcon, and, due to the good deal I got
from Systems Solutions, got a 120MB internal to add to the 105MB external
(and I can now ditch the slow second external I had on my ST). The free
software I got with the internal drive was
1) MultiTOS: I've already got this
2) AFM: Waste of disk space
3) Breakout: Ditto
4) Landmines: Ditto (and buggy).
5) SAM: Ditto (I don't really need sampled explosions when
my programs crash!)
6) Calappt: Don't need it, so haven't even tried it.
7) ProCalc: Ditto.
8) AHDI: I currently use this, but it's not as good as the ICD
stuff I had on my ST, so ICD Pro is high on my shopping
list.
9) Er,
10) That's it.

No SpeedoGDOS (but I've already got that anyway). None of the things that
were originally claimed, like D2D, Atari Works).

For Term you'll need Net-021.zoo and modm0dev.zoo. I don't have a
serial MFP-port on my FALCON so I can't use Term.

> I've downloaded a uucp package from the Mint/Tos/Utilities dir. at

This was the last release of the excellent port, which works really
fine. You should get the original sources and docs, or you won't be
able to set up it correctly.

> This may be a light-hearted joke, but I was getting the impression

Well, it's only beta v0.2 or something so give it a chance! I think the fact that it was ported from X is pretty impressive. It runs quite well with a maths co-pro but otherwise is rather slow.

Source record: 192248

Where can I find the latest ST Report. I downloaded STR1008.ZIP off a local Atari ST Forem board, but PKUNZIP on my PC says it's corrupted, I also get an error using ST ZIP. I've never gotten a bumb ST Report before. I looked on a.a.u.e in the /atari/Magazines/STR area, but they only have issues going up to STR1002.LZH They are 6 weeks behind. Can someone upload the most recent issues to a.a.u.e.?
Eric

3742. GDOS driver for HP Deskjet 550C printer

Newsgroup: comp.sys.atari.st
Date: 1994-02-24 13:17:25 UTC
From: verwows@risc2.unisa.ac.za
Message-ID: <2ki9d5$91a@goofy.unisa.ac.za>
Source record: 192249

I'm looking for a GDOS driver for the HP Deskjet 550C colour printer. I do have a driver for the 500C, but that does not use the black cartridge; i.e. it uses CMY instead of CMYK. Doe anybody know where do get one?

Thanks! Wynand Verwoerd.

3743. Is there a C-compiler which handles 4-byte integers?

Newsgroup: comp.sys.atari.st
Date: 1994-02-24 13:18:14 UTC
From: ipoorten@cs.vu.nl
Message-ID: <CLqCyF.F8s@cs.vu.nl>
Source record: 192250

I was wondering if there is a C-compiler for the ST which handles 4-byte integers. It's a bit frustrating to do everything with longs, or having to debug several hours, when I wrote my program on a Sun here at the university. I know of gcc, but everybody told me that it won't work correctly on a 1Meg 1040STe + Harddisk when compiling programs bigger than printf("Hello\n");

Is there another one? (Currently I am using H&SC or Turbo C 2.0)

Thanks in advance,
Ivo van Poorten

Why would it slow it down? A one-time check as the game is
first run to figure out the res should be it, or am I simplifying
things a little too much? (I'm not real sure of how you are doing
the check, so I dunno)...

Anyways, it would be cool to see. Actually, you might even think of doing
at least a 640x200x4 version, which any Atari could use, or even a
640x480x16 version which TT/Falcon owners (and us with normal ST/e's
under MonSTEr) could use. How much constraints do you have on the
resolution side? (i.e. how difficult would it be to have the choice
of say "640x200, 640x400, 640x480, 800x600, 1024x768" etc?). Just
curious...

Rob

[STuff deleted]

>Fair comment. I urge ST users to get a monochrome monitor. 640*200 is such
>a stupid mode I can't see why you bother.

Ofir, we do 640x200 mainly because that is what most of us are
stuck with on stock ST/e's (and color is a lot easier on my
eyes than mono). If I ever get my AlberTT synced up with my monitor,
then I won't be stuck at 640x200 in color res anymore, and I can
escape the black and white monotony of ST Hi res (which I currently use
for the most part). The color makes a big difference, even if it is
only 4 colors...

I'm not sure if this is realistic to say, but I would assume (*warning*:-)
that monochrome is more in favor in Europe than say the U.S. (assumption
based on the fact that a lot of cool monochrome stuff comes out of
Germany, etc)...

Besides, blame Atari for the funky resolution ;-)

I think it would be safe to say (anybody?) that 4megs is probably
the minimum you'd want if you're gonna use GCC or GNU C++ (since Gnu
is really not optimized for the Atari's hardware)...

Besides, once you're at 4megs, you'll never know how you survived
without it :-)

>NOT ME!!! I'd pay $60-$80 for a mediocre Falcon game and $120-$150 for a good
>one. This is not because I'm rich. (I'd probably only buy one game at that price.)

You're just not going to see any Falcon games at your local dealers for a
while (if ever) - it'd be financial suicide to put out a Falcon only game,
ATM.

Which is why a selection of shareware games at sensible prices is a great
idea - few people would register a shareware game for 60-150 dollars,
whereas a lot of people would for 20 dollars.

>program at my dealer. So I bought it. (I needed to have something run on my
>Falcon besides Landmine, and none of my ST stuff worked.)

You must have been using some very non-standard software then - almost all
of my serious applications ran perfectly. The three exceptions were
STraight Fax (solved by an upgrade), Protext (ditto) and That's Write 1.51
(which i've not yet bothered to upgrade).

>game, but I wouldn't call that arcade.)

Try Frontier: Elite II - that works very well on the Falcon, very smooth,
very playable.

It supports both Ansi and does have auto-zmodem - what is 'real'
auto-zmodem?

>Why not Try it, its on A.A....!!!

I have tried Storm, that's where this thread started - to me, it is
complete and utter unusable rubbish. I wish American programmers would
start to use German style interfaces rather than making up their own
interface for each program they make.

>>Try them out - although I'd recommend neither in ST Medium Res. In fact,
>>to be honest, I wouldn't recommend doing any serious work in that
>>particular mode.
>>
>
>Please read my comments to Ofir regarding Med Res and ST/STE's

I've just commented to them myself, beyond those comments I still think
that FZT is the only answer (that i know of) to using comms in ST/Med Res
mode. It's not a program I'd use myself now since it isn't GEM'd up.

From: lannie@picard.infonet.net
Message-ID: <2kihfc$ome@insosf1.infonet.net>
Source record: 192261

I am about to purchase a Falcon and I have some questions.

First, Could someone tell the specs on the 286 Emulator for
the Falcon? I need to know Norton Rating, VGA, SVGA?
Does it do 256 Color and if so what rez's. Does it support
the Stereo sound in the Falcon as an IBM Sounblaster or etc?

I need to know of a good place to buy the Falcon, Emulator, and
SVGA monitor, and Blowup II from. I need to get it all from the
same place cause my company is buying it. I keep calling Toad
and they say they are waiting for info from the Blowup manufacturer
before thay can sell it. I called the manufacturer and they are
waiting on Toad to call them. Any good places to buy from that
will accept a P.O. from my company will work.

Thanks!!!!

>MiNTlibs) doesn't truncate my filenames on me...

Depending on your setup, you might have to set UNIXMODE when using minix partitions. I have UNIXMODE set to /rU most of the time. The '/' is probably not needed when using minix partition exclusively, but you get problems when you try to access TOS partitions without having the slash in UNIXMODE. And if you don't have 'rU' (or some other root drive) in your UNIXMODE, absolute paths depend on your current default drive, which is not what you want most of the time.
Generally, you're far better off regarding UNIXMODE when you compile your binaries yourself, since that enables you to control which version of the mintlib is linked to produce the executables. If you're using binaries obtained from ftp or other sources, the fact that they're most likely linked with different versions of the mintlib (that have different levels of UNIXMODE support) may well force you to play around a lot with the UNIXMODE environment variable.

>Why should I need to set UNIXMODE to anything while I'm running on a
>minixfs partition under MiNT? The MicroEMACS I compiled (with the
>MiNTlibs) doesn't truncate my filenames on me...

The MiNT library ignores most of the traditional UNIXMODE settings.
If you want to be able to run programs compiled with the GCC-TOS
library, you'll need to set UNIXMODE to some reasonable value. This
wont hurt programs compiled with the MiNT library.

Try setting UNIXMODE to: /rUcub

/: Allow / and \ as path separators.
rU: use drive U: (MiNT unified filesystem) as the default root drive.
c: do not translate lowercase to uppercase
u: unlimited filename length (do not truncate to 8+3 DOS filenames)
b: default to binary mode with fopen() (this one you may want to leave
off if it causes problems, most programs that really need
binary mode all the time call _binmode(1) during startup to
take care of this for you.)

Here's UNIXMODE.doc for your reading enjoyment:

--cut--
The UNIXMODE Extended Filename Standard

0. Summary

The UNIXMODE extended filename standard provides a uniform, user-controlled
way of mapping the user's name for files (which need not conform to the
GEMDOS restrictions on length and case) to the names by which GEMDOS
knows them. It is intended to be as compatible as possible, e.g. whenever
reasonable the GEMDOS name of a file should match the name that GEMDOS would
have assigned to the name by it's usual conversions. File names with
multiple extensions are permitted by translating the '.' character to a
user-specified replacement (e.g. '_'). Long file names, and file names
with mixed upper and lower case, are represented by entries in a special
file, ".dir". This file also contains entries for Unix-like symbolic links.
Programs use the ".dir" files in the appropriate directories to translate

file names to/from GEMDOS. All translations are controlled by the user through the environment variable UNIXMODE.

1. Rationale

GEMDOS filenames are limited to an 8 character name plus a 3 character extension. The names must be all upper case, and must not contain certain characters (such as ' ' and '.'). Many other popular operating systems, most notably Unix, have much more flexible naming conventions. Moving files from computers running such operating systems to an Atari ST can sometimes present problems.

Moreover, short filenames are sometimes not very descriptive at all. Having longer filenames, with fewer restrictions, makes remembering what's in the files *much* easier.

2. The Proposal

We're stuck with GEMDOS's rules, at least for the time being. However, there's nothing preventing programs from storing extra information about filenames. Thus, a program could know that when the user refers to "govt.letter.april1" to actually use the file "GOVTLET.AP1".

The UNIXMODE extended filename standard provides a uniform method of associating long filenames with shorter, GEMDOS compatible filenames. "UNIXMODE" is the name of an environment variable. This variable contains information about how the user wishes file names to be mapped. File name mapping can be turned off completely, or altered to reflect changes in the file system. Thus, programs using the UNIXMODE standard will still work correctly in future versions of GEMDOS (or GEMDOS emulators) which allow longer or otherwise more flexible file names. Also, UNIXMODE standard programs do not impose their will on the user; the user controls whether or not, and how, extended filename mapping is performed.

Programs that use the UNIXMODE standard can allow file names up to 31 characters in length. These file names may be mixed upper and lower case, with periods and even spaces in them (although the latter is not recommended). The only characters *not* permitted in file names are the null, tab, newline, and carriage return characters.

The UNIXMODE standard also provides for symbolic links. These are special directory entries that "point to" other directory entries. They provide an easy way to reference the same file under more than one name. For example, if there are several versions of a document under revision simultaneously, a symbolic link called, say, "current" could point to the most current version. An editor that followed the UNIXMODE standard could be invoked by, say, "edit current" and would correctly retrieve the current version.

In fact, under the UNIXMODE standard, long or otherwise unusual file names are implemented by a special kind of symbolic link, the "automatic" symbolic links. These links (also called "aliases") are used in mapping long file names to ones that GEMDOS understands. If the user has made

provisions for allowing automatic links (see below), then every time a
file is created whose name is not acceptable to GEMDOS, then the file's
name is modified to be acceptable, and a symbolic link with the user's
preferred name for the file is created.

3 Filename Translations

Programs that follow the UNIXMODE standard will translate file names in
certain standard ways. These translations may be over-ridden by various
options in the UNIXMODE environment variable, but in general it is best
not to override them.

When translating from user names to GEMDOS names:
(a) if a symbolic link is found with the same name as the user name,
it is used.
(b) the character '/' may be converted to '\', depending on user options
(c) filenames are converted to upper case
(d) occurrences of the character '.' may be converted to a user-
specified character, to prevent conflict with GEMDOS
restrictions on extensions
(e) filenames are truncated to have an (at most) 8 character base and an
(at most) 3 character extension.

When translating from GEMDOS names to user names (e.g. printing the name
of the current directory):

(a) '\' may be converted to '/'
(b) if an automatic symbolic link exists to the file, then that name
is used instead of the file name
(b) filenames are converted to lower case
(c) occurrences of the user-specified replacement character for '.'
are converted back to '.'.

If the user name is not already a symbolic link, and the conversion from
user->GEMDOS->user again would change the name, then an automatic symbolic
link may be created for the file name. This allows the user to refer
to the file by its full name, and also allows the program to print the
name by which the user wishes to refer to the file, rather than the name by
which GEMDOS knows the file.

Examples:
If all of the above mappings are asked for by the user, and the user
specifies the character '_' as the replacement for '.', then

user name: becomes:
foo.bar FOO.BAR
foo.bar.c FOO_BAR.C
longname1.extension LONGNAME.EXT *
ReadMe README *
a_file.doc A_FILE.DOC *

In the cases marked (*), the user name is not recoverable from the GEMDOS
name. In these cases, programs should (if the user requests it) create

automatic symbolic links from the user name to the GEMDOS name; such links
will allow programs to properly recover the user's desired name for the files
in ds, etc.

3.1 The UNIXMODE Environment Variable

The environment variable UNIXMODE contains the user's preferences for
file name mapping. Each character in the environment variable string
represents one of the options below. If the UNIXMODE variable is not
found in the environment, programs may assume whatever defaults are
appropriate. It is recommended that symbolic links *not* be active by
default. The empty string is a reasonable default, providing complete
GEMDOS compatibility. The GNU C library assumes a default of "/", for
compatibility with old code.

The characters in the UNIXMODE string have the following meanings:
(characters inside of angle brackets <> are supplied by the user; thus
"r<c>" means the letter "r" followed by any other character, which will
be referred to in the text as "<c>")

/ -- Allow the use of '/' as well as '\' to separate the directories
in a path name. If the "/" option is given, then the name
"foo/bar" refers to the file "BAR" in the directory "FOO".
Otherwise (the default) it refers to the file "FOO/BAR" in the
current directory.

.<c> -- Translate multiple uses of the '.' character to the
character <c>. Normally, GEMDOS allows only one '.' in a
file name, and it introduces the extension. This option allows
extra extensions. All but one (or perhaps even all) '.' characters
are converted into <c>. At most one '.' will be left; this will be
chosen to minimize the number of characters lost to the 8+3 rule
(unless the "u" option is in force, see below).

Example: if "._" is found in the UNIXMODE string, then the
following translations will occur:
foo.c.z becomes FOO.C_Z
foo.c.bak becomes FOO_C.BAK
a.b.c.d becomes A_B.C_D
foo.bar remains FOO.BAR
.login becomes _LOGIN (rather than ".LOG")

If the "." option is present, programs should convert filenames
back to what the user expected, e.g. in the above, "A_B.C_D"
should be displayed to the user as "a.b.c.d".
Note that if a file name would contain the character <c> used
for mapping '.', and automatic symbolic links are active,
then an automatic link should be made for the name.
Example: if ".@LA" is in the UNIXMODE string, and the
user enters the name "foo@bar.c", then a link from
"foo@bar.c" to "FOO@BAR.C" should be made, so as to
distinguish "foo@bar.c" and "foo.bar.c".

The translation character <c> must not be an alphabetic
or numeric character (if it is, this option should be ignored).
It is recommended that users adopt either ',' (comma) or '_'
(underscore) for this character.

- -- The minus character is guaranteed to have no meaning. Thus,
if the UNIXMODE string consists solely of "-", the effect
is the same as if it were empty. This may seem puzzling,
but is necessary because many programs are incapable of
correctly recognizing empty environment strings.

d -- Provide a pseudo-device directory. Filenames that begin with
the characters "/dev/" are assumed to refer to devices.
The devices available may vary, but the following devices must
always be present:
/dev/console same as GEMDOS file CON:
/dev/tty1 same as GEMDOS file AUX:
/dev/lp same as GEMDOS file PRN:

r<c> -- Provide a default root drive. If the "r" option is present, then
the search for a file whose name begins with a directory separator
(e.g. '\') and which have no explicit drive letter present will
begin on drive <c>. If the "r" option is not present, then
the search will begin on the current drive (the default). Note
that the actual drive on which the file is found may differ,
if one of the components of the file name is a symbolic link.

Example: if "rC" is set in UNIXMODE, and the current directory
is "D:\FOO\BAR", then the filename "\bin\sh" refers to the file
"C:\BIN\SH", not the file "D:\BIN\SH" as it would normally.

L -- Allow, and recognize, symbolic links. See below for a more
complete description of this option.

A -- Automatically create links to files whose user names are not
recoverable from the GEMDOS names. Automatic links are much
"tighter" than normal symbolic links; for example, removing
an automatic link will also remove the associated file or
directory, whereas removing a normal link removes the file, only.
Also, automatic links should appear in directory listings in
place of the associated file; normal symbolic links appear in
addition to, but not in place of, the files they are linked to.

If an automatic link is created, and then the "A" option is turned
off by the user, the automatic link will behave like a normal
symbolic link until the "A" option is turned back on.

The "A" option is meaningful only if the "L" option is also given.

H -- Hide the ".dir" file that symbolic links are contained in
from directory searches. The file may still be manipulated by,
e.g. "Fdelete", but should never be shown to the user in a
directory listing, file selector, or similar display.

The next two options are provided for compatibility with replacement
file systems running under GEMDOS, or similar extensions to GEMDOS. They
should not be used in the normal environment.

c -- Pretend case is significant in file names. If this flag is
present, then UNIXMODE programs will not translate the case
of file names in any way, and will assume that case is significant
to the underlying operating system.
The "c" flag should *not* be used in present versions of GEMDOS,
since these are case insensitive. It is provided so that programs
will work correctly under GEMDOS extenders or future versions of
the OS.

u -- Assume file name length is unlimited. Like the "c" option, this
should not normally be used under GEMDOS. If "u" is not present,
it is assumed that the operating system recognizes only the first
8 characters of the filename, and 3 characters of the extension
(if any). If "u" is present, then it is assumed that files may
be of any length, and may contain any number of '.' characters. If
the second assumption is false (e.g. a GEMDOS emulator running on
VAX/VMS) then the "." option must be used to translate extra
occurrences of periods.

4 Symbolic Links

Symbolic links are implemented by special GEMDOS files named ".dir". Such
a file should appear in any directory in which a symbolic link appears.
If the "L" flag has been given in the UNIXMODE environment variable, then
programs should look in any ".dir" files anywhere along the path of a
file being opened. This means that symbolic links to directories are
permitted, and function as expected.

Example:
Suppose a program attempts to open the file "c:\foo\ReadMe". If the following
symbolic links are present:

in directory "c:": "foo" is linked to "d:\sub\dir"
in directory "d:\sub\dir": "ReadMe" is linked to "..\Important"
in directory "d:\sub": "Important" is linked to "vital.txt"

and if the "L" option is active, then the name "D:\SUB\VITAL.TXT" is passed
to GEMDOS for the actual file open operation. The translation proceeds as
follows:

c:\foo\ReadMe -> d:\sub\dir\ReadMe -> d:\sub\dir\..\Important ->
d:\sub\Important -> d:\sub\vital.txt (-> D:\SUB\VITAL.TXT).

[The last step (case translation) may actually be interspersed with the other
steps; part of a name may be converted to upper case as soon as it is known
that it is not a symbolic link].

4.1 Implementation of Symbolic Links

In every directory that contains a symbolic link, there is a file called
".dir". Each symbolic link occupies a single record in the file (records

are separated by a newline character). Each record consists of 2 or 3 fields, separated by tab characters. The first field is the user's name for the symbolic link, e.g. "ReadMe". The second field is the destination of the link, e.g. "d:\sub\dir". This destination need not be a complete path, nor need it be in GEMDOS format; i.e. the destination name will be converted just like all other user-supplied names. The (optional) third field consists of flags for taracter that has meaning in this field
is the letter 'A', which (if present) indicates that the link is an automatic link. However, programs must preserve all characters in the flags field when manipulating symbolic links, so that they will work correctly with future extensions to the standard.

Carriage return characters are ignored everywhere in the symbolic link files. Programs should neither require carriage returns after the line feed ending a record, nor forbid them.

5 Extensions

There may be future extensions to the standard. Programs should ignore, without reporting an error, any characters that they do not recognize in the UNIXMODE environment string or in the flags field of symbolic links.

The GNU C compiler library supports the following additional option in the UNIXMODE environment string:

b -- Open all files in binary mode. With this option, new lines in text files are indicated by a line feed alone, rather than the customary carriage return/line feed combination.

--cut--

p.s. it's all Eric's fault :-)

I use this one A LOT! I think it is great. I usually listen to my stereo
through this.

> 3) Breakout: Ditto
It is OK

> 4) Landmines: Ditto (and buggy).
Mine is not buggy.

> 5) SAM: Ditto (I don't really need sampled explosions when
It would be really nice if I had 14 MB of RAM. The sound sampler is nice
and very easy to use for both recording and playback. Worth getting IMO

> my programs crash!)
> 6) Calappt: Don't need it, so haven't even tried it.
> 7) ProCalc: Ditto.
Use it all the time :)

> 8) AHDI: I currently use this, but it's not as good as the ICD
> stuff I had on my ST, so ICD Pro is high on my shopping
> list.
What is the difference? You format the drive once and partition it and
that is it. As long as you have AHDI6.01 you should not have any problems.

> 9) Er,
> 10) That's it.
>
>No SpeedoGDOS (but I've already got that anyway). None of the things that
>were originally claimed, like D2D, Atari Works).

Atari Works is pretty nice and so is D2D; these two are worth it even
without mentioning all of the above stuff which is also grat IMO.

>it is a different story (well , it is here in Europe!) the CD32 has
>been advertised on T.V and satellite (MTV Europe) and on billboards
>(like the one outside Segas European HQ ..."To be this good will take
>Sega ages..."). It has also been reviewed etc in gaming magazines
>(not just Amiga magazines) . The opposite is true of the Jaguar . It
>hasn't been released over here ....well, if it has , it isn't
>being advertised anywhere , nor do any large electrical or computer
>stores sell it .

I've heard that the Jaguar's UK/European debut has been delayed. The
funny thing is that Atari has basically echoed Commodore's statement
about European sales being so good that the American debut was put
off, only in reverse. I'm not so sure that this is true, I suspect
that they simply do not have the resources to mount an effective
campaign in Europe and the UK right now, just as C= appears to be
unable to do so in the US.

> I believe that Commodore's Ad campaign will be lower key in the
>U.S. but this won't be due to C= not knowing how to market machines ,
>it'll be due to lack of financial resources . (money...something
>Atari don't have much of either) . However the money they are making
>will probably partially go towards advertising in the U.S (not just
>in AC and Amiga World)

The Jaguar may be Atari's last hope, I'm not sure that the CD32 is as
essential to Commodore.

> At first the U.S Amiga mags will be the only place it is advertised
>but it will catch on... (it is a nice earner for C= here in Europe).

The problem with that is that the people who are reading those
magazines will already know what the CD32 is. There is no point in
advertising there, except perhaps to keep the publishers happy. A
single ad in a gamer magazine is more worthwhile than a year of such
ads in AmigaWorld, yet C= just can't seem to grasp that concept. If

they want to sell a few hundred thousand CD32's to existing Amiga owners, they don't even need to bother with the AmigaWorld ads. If they want to sell a lot more units to a lot wider audience, they need to wake up and realize where the market is.

PageStream 3 for that "other machine" will be a complete rewrite and
will have quite a few new features.
If the Atari version goes ahead, it will probably also be a total rewrite
and will probably eliminate all the annoyances that cropped up during the
relatively minor upgrades.

It has been mentioned that the people at Soft-Logik like Ataris and use
Ataris. It may not be totally unlikely to get them to do the upgrade
if current owners get few hundred letters in before they decide.

3774. TT 19" monochrome QUESTIONS

Newsgroup: comp.sys.atari.st
Date: 1994-02-24 21:54:04 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <CLr0u4.452@watserv2.uwaterloo.ca>
Source record: 192279
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I finally took the plunge, I am getting a TT (used) this weekend. I bought a 19" Moniterm VY1000 mono monitor for $100 at a surplus store (it also included an AT graphics card with 1meg of memory and cables).

Anyway, someone local here offered to help me try to get it working. I do have some questions (since I haven't talked to him in a while).

1. Is the monitor connector on a TT 9 or 15 pin?
2. Are the mono signals ECL or TTL (not sync, just video)
3. WIll i need to invert sync for a Moniterm monitor?
4. The monitor I have has a 9 pin input with the following pinout:
(the only manual I have is for the graphics card - and these are the specs)
1. Video1+ ECL
2. Video2- ECL
3. Video2+ ECL
4. -5 volt input
5. Horizontal sync TTL
6. Video1- ECL
7. GND
8. GND
9. Vertical Sync TTL

Anybody know what kind of problems I'll run into? Anyone know of any dip switch settings or jumpers in the monitor which may be useful? As i said, the above data is from the supplied graphics card manual (which is why there is a video1 and video2?)

I hope this works!

Thanks for any help,
Sam

>
>perhaps would work on my TT in TT High, but no. No windows... Apparently only
>
>ST-Hi. will work correctly. I did get part of the display in the upper left
>corner of my screen, but nothing useable.

It does use GEM - well mainly the VDI with a couple of alerts etc chucked in. There are no windows however.

Its screen size is fixed at about 500x350 as this is half the dimensions of the X-Windows version and saves a lot of rewriting of code with very little penelty for speed. Auto sensing screen size just takes up too much CPU time.

Its probably *is* working correctly on your TT, but not usefully ;-)

BTW it makes absolutly no screen size checks - so should work in any suitable sized resolution, not just ST HI.

Roland.

>protection schemes to be a nuisance, and will 'crack' any software
package
>that I opwn if I can.

Your opinion. Most license agreements that come with the software you
purchase prevent you from modifying that software. While it doesn't take
food out of the programmer's kitchen, you could be breaking the license
agreement.

I have a better idea, if you don't like the idea of software protection,
do what I do: I don't buy it and I don't use it. But, then again.. I only
use productivity software or development software (compilers, word
processors, databases, etc.) so I guess I am not as likely to run into
this problem.

> As far as doing something positive, I don't find designing protection
>schemes to be very postive. What a waste of programming expertise; it
would
>be better to focus ones energy in bettering the product, rather than
>using time and expense to design a better 'cracker proof' scheme.

I agree. But anything is better than breaking protection schemes and
distributing them. And believe me, there are more people out there
breaking programs and giving them to thier friends (or worse yet, SELLING
THEM) than there are people like you who break them for their own use.

>BTW, most MSDOS programs (yes, even games) have dropped protection
>alltogether and have not noticed a drop in revenue. What revenue is lost
>is made up in happy repeat customers.

It's amazing what a healthy segment of the market can do, isn't it? But,
the Atari platform has to depend on a larger percentage of the users
buying programs than the IBM world does. Assuming that the level of
piracy is the same and given the size of the Atari and IBM markets, the
Atari world can't tolerate piracy very much. It really hurts big time.

>In a nutshell, software with any protection SUCKS in my opinion.

I don't mind games having protection, like manual lookups and stuff like
that. I don't like copy protected disks though.

From: lai@paf.gsfc.nasa.gov
Message-ID: <2kja1o$jcn@paperboy.gsfc.nasa.gov>
Source record: 192282

Will someone post the FAQ for this group or tell me where I can find it.
I got an Atari 1040ST back in 1986 and lately I got some Mega STs with an
SLM804. I have been using Linux, MS Windows, OS/2, Solaris, etc. and I am
just getting back to Atari. I had CAD 3D 2.02 from Tom Hudson which was fun
and I was wondering if new version of CAD 3D is still being released or is
some other software now being used. I heard about TT long time ago but
nothing about Falcon or other machines. I would like some information
about what is out there. Our local dealer in the D.C. area Calcom has
long since closed.

thank-you
Keith Lai

The source is there too - fix it.

I'd do it myself if I had the time, because it is amazingly slick
on the NOVAplus card. BTW, it works is any monochrome mode, I suspect,
as it works in 1024x768.

Almost works in colour too - they just don't do use the right VDI
functions (using vro_cpyfm() rather than vrt_cpyfm(), I suspect).

It should be totally VDI legal (ie opens a workstation etc, but doesn't
bother with windows). It *is* resolution dependent though. It needs about
500x350 pixels, but doesn't case what screen mode you are in.

Roland.

>Pardon? All you've got to do is to use the appropriate VDI system call to
>find out what the current resolution is. This will take only a few
>microseconds at the beginning of the program.

This isn't the problem. The problem is that there are hundreds of hard coded co-ordinates in the program which seem to work on a 1000x700 resolution basis. All I do is bit shift these values in my replacement draw routine (which in itself calls the VDI) so that it brings them all in the 640x400 range (500x350 actually).

>The use of VDI functions is the only way to handle all possible resolutions
>correctly, especially odd ones like those offered by OverScan and the like.

I dare say using NDC corordinates would help, but AFAIK this require GDOS to work, and slugs the performance (which is hardly sparkling anyway).

>If you're not sure about how to take advantage of VDI, I'm going to look it
>up for you.

Thanks :-)

>By the way, I cannot imagine that the XWindows version is restricted to a
>single res, or is it?

Well its not restricted to a single res - but the CBZONE appears to be. It requires a minimum of 1000x700 pixel window and all the hardwired co-ords seem to fit this. AFAICS X-Windows itself is responsible for any other scaling. Also according to my X-Windows book (X Window System Programing by Naba Barkakati):

"In X, coordinates are specified in pixels, which makes X dependent on the resolution (pixels per inch) of the display screen."

Also I claim ignorance. I have no access to X-windows technology, and I did this port without ever seeing a copy of CBZONE running under X (or playing it in any version for that matter)!

:-)

Did you try varying the setups with CoNnect for instance??

>So don't we have any Real Comms Programers out there...:-)....????

Yes we do!! Just because a new implementation comes out and some of the
older software aren't compatible "out of the box" with it, doesn't mean
that there is any lack in the programming department. A lot of the comms
software for the Atari is of very good quality. At the _most_ all you
can say is that they may not have had the opportunity to catch up with
this particular implementation. It doen't really tell you a lot!

There are some very good reasons to think about getting ICD Pro, especially if you have a Syquest drive or an existing ICD formatted drive. It's also useful if you have a large drive or two with lots of folders.

The ICD Pro driver gives you read/write caching, which you can enable or disable with their CPX. It comes with DESKTOP, a program that allows you to reassign disk partitions on the fly -- very useful if you happen to have more partitions than C-P (under TOS, MultiTOS allows more).

You can have multiple boot partitions under TOS with ICD Pro, and boot your machine on each one by holding down its letter at boot time. If you want to use a disk with more than four partitions that's already been formatted with ICD's formatter, you have to use ICDBOOT; GEMDOS gives you only the first four partitions. For me, this was a necessity since I had several 88 meg Syquest cartridges with more than four partitions apiece! Swapping a cartridge is easy, too -- the ICD CPX will reread the partitions at the click of a button.

Lastly, they've bundled ICD CleanUp, which is a handy utility for tracking down disk problems (Diamond Edge is way better, but costs more than ICD Pro altogether). The ICD Pro package isn't an absolute must, but it's well worth considering!

PS - It has its own CD ROM driver too.

I can't see how 50/60Hz is easier on the eye than 71Hz. In any case,
support of 640*200 will gradually disappear. It makes programming user
interfaces a real pain.

It really depends on the operations conducted.... the DSP is highly
optimized, so if you are asking it to do what it is designed to, you CAN
get close to 96 MIPS. Although most likely the operations wilnot
get that fast.

Source record: 192159

cherborth@semprini.waterloo-rdp.on.ca (Chris Herborth) writes:

>Maybe Warwick will post a GEM "hello world" in C++; it's probably about
>five lines.

>C++ is much better suited to writing GEM applications than C.

>C++ es mui macho! :-)

```
#include <gem++.h>
#include "hello.h"

main()
{
GEMapplication application;
GEMrsc rsc("hello.rsc");
GEMactivity activity;

GEMformwindow hello_window(activity,rsc,HELLO_FORM);

hello_window.Open();
activity.Do();
}
```

Or, in 5 lines...

```
#include <gem++.h>
#include "hello.h"
main() { GEMapplication application; GEMrsc rsc("hello.rsc"); GEMactivity
activity; GEMformwindow hello_window(activity,rsc,HELLO_FORM);
hello_window.Open(); activity.Do(); }
```

Of course, any similarly powerful GEM library for C will be able to
do exactly the same thing is as much code. Probably something like:

```
#include <super_gem_library.h>
#include "hello.h"

main()
{
GEMapplication application=OpenApplication();
GEMrsc rsc=LoadRSC("hello.rsc");
GEMactivity activity=CreateActivity();

GEMformwindow hello_window=CreateFormWindow(activity,rsc,HELLO_FORM);

OpenFormWindow(hello_window);
DoActivity(activity);
```

```
CloseApplication(application);
}
```

The good thing about C++ is that you can EXTEND the library with your own extensions, rather than waiting for the library to keep growing and growing as more and more features get added for all possible situations.

In no way do I knock C programmers using GEM libraries. They're great, and there are some great GEM libraries out there in C. With C++, you have the choice of just one compiler (GNU C++), one GEM library [as far as I know] (GEM++). Also, you need at least 4M to use GNU C++.

```

3809. Hard Drive? Falcon?

Newsgroup: comp.sys.atari.st
Date: 1994-02-25 18:54:07 UTC
From: Lyle Raymond <nwanda@chop.isca.uiowa.edu>
Message-ID: <762201970-0-1077@chop.isca.uiowa.edu>
Source record: 192166

I'm looking to purchase a hard drive for the 1040STe, used if possible (I'm on a budget).

Also, how does the Falcon compare to the ST? In terms of RAM? MHz?
...and if someone can providwe specs on the Stacey, let me know.

I can be reached at 94807713@uwwvax.uww.edu

Thanks,
Lyle Raymond

3810. Synths, ST S/W For Sale

Newsgroup: comp.sys.atari.st
Date: 1994-02-25 20:04:12 UTC
From: glennd@pioneer.arc.nasa.gov
Message-ID: <1994Feb25.200412.23466@news.arc.nasa.gov>
Source record: 192167

I've got the following for sale:

Hardware (All have remained stationary at home; original owner of all except for CZ101, all in great condition).
---

1) Casio VZ10M $275

iPD (interactive phase distortion) rackmount synth
[Casio's version of FM]
manual, ROM cards, & Sound Source bank

2) Casio CZ101 $125

PD synth w/ mini-keys
original box, manuals, & dust cover

3) Alesis Quadraverb Plus $300

"Plus" algorithms include ring mod, resonance, and sampling

4) M1 "Synth 2" PCM card/patch card set $40

Nice sounds; I'm only selling because I'm trading my M1 for a TG77

Atari ST software
---

5) Steinberg Synthworks M1 ed/lib $50

Awesome dedicated ed/lib for M1 and ST. Excellent graphical interface. Originally $200

6) Dr. T's VZ-Rider ed/lib $50

Makes editing the VZ a dream compared to its front panel. Editing of all VZ params. Out of production. Originally $100

7) Drumware K1 ed/lib $30

ed/lib for Kawai K1 & K1 II; Originally $120, full-function; automatic patch generation

8) CZ-Android ed/lib $20

ed/lib for Casio CZ-101l; Originally $100; automatic patch generation;

I prefer to sell locally; in the S.F. South Bay Area or Santa Cruz.
Otherwise, buyer pays shipping.

Well it's everywhere in Brighton - and it's got a fully working version
of Calligrapher Pro. The only things that are missing are the spell checker
and the printed instruction book - plus a number of fonts.

You get three fonts, a Serif, a SansSerif, and a bullets type font.

I was thinking of buying it, good job I didn't really! ST Review are
alowing you to get the extras at low cost, this includes a number of
PAK modules and more fonts. BTW - The PAK modules that are given on
the coverdisk allow you to import text (ASCII, RTF etc..) and import
DEGAS and NEOCHROME files etc...

Well worth the coverprice this issue I think (and that's coming from me!)

Hi Gregg,

I'll try to keep this brief to save bandwith. After all this is an Atari conference. If/When Atari comes out with a PPC-based machine it might be more appropriate to extrapolate in more detail.

> Well, he does have a few valid points, but in general I think he's
> just blowing his horn.

Thanks for acknowledging them although when it comes to "horn blowing" as I freelancer I have no horn to blow. I call 'em as I see 'em. However, to put things in perspective, you yourself have a horn (considering your involvement) but since it's Moto you're being loyal to all is forgiven :-) because...

> Thanks for the vote of confidence for Uncle Mo!

...credit where credit is due!

> The 601 instruction set was defined by IBM.

Precisely. Need I say more?

> The PowerPC instruction set is
> a subset of even the 601 instruction set. Therefore, the 601 has
> several instructions that are not part of the official PowerPC
> instruction set.

Exactly. And that's my point. I'm yet to see an IBM product where marketing was not the prime design prerequisite often (always?) going against technical requirements.

> BTW, what's a 602?

A 601 after a typo...

> I must confess that I didn't read all of the 620 Book IV document (which
> describes the instructions that that processor implements in addition to
> the PowerPC required instructions), but I would tend to think that Don
> is referring to the 64-bit instructions.

Yes, as well as floating point and some control functions.

> At first reading the PowerPC instruction set looks awfully big, but then
> you realize that the "Load 16-bits" instruction is listed separately from
> the "Load 16-bits and Zero the upper 16-bits while you're at it" instruc-
> tion! There must be well over a dozen "Load" instructions and well over a
> dozen "Store" instructions!

True, but even accounting for that it's 180+ and that's still on the
bloated side for a *reduced* instruction set.

> You are correct about the bus on the 60X devices. It is a "split" bus
> where in a multiprocessor environment it is entirely possible to have a
> seperate master of the address bus than the data bus at any given time.
> The 60X bus is a 64-bit data bus that is "flow controlled" by the memory
> subsystem. The 620 bus has a 128-bit wide data bus that is "flow controlled"
> by the data provider (620 on a write, memory on a read).
> ...
> No, this 620 won't be an "overdrive" for a 60X, but BFD.

Correct again. You have therefore confirmed all of my statements.

The point is: How many of those drooling all over the PPC in public and
posting to that effect know all this? The overriding impression given by
these groupies (intentionally or not) is that PPC is a new dawn of computing
- up/down-ward compatible ad infinitum. Even PPC's capability to handle both
big-endian and little-endian byte ordering has been perverted in popular
folklore into "hardware emulation of other processors" - which is patent
nonsense as you will no doubt agree. A lot of people seem to have suspended
their critical faculties and bought into this marketing ploy.

True, that's an ignorant point of view but that's exactly what I was
trying to debunk by presenting some facts to put things in perspective.
It should also be noted that you have confirmed all these facts, in short:
There is no *de facto* unified instruction set (in practice) and upgrading
from 60x to 620+ will not be a case of simple processor replacement. We may
disagree on interpretation/importance of these facts but they stand
nevertheless and people ought to be aware of them.

> Sometimes to make a quantum leap in performance, you have to
> break from the past.

Bingo! Like abandon the unholy trinity of IBM/Intel/Microsoft... :-)

But seriously, why bother with the corrupt past at all? Why not make
a clean break and the same type of leap as when the 68000 was introduced?
Why anchor yourself (Moto, I mean) to R6000 (a niche market at best) in the
first place?

All the best!

P.S. A brief note re other, offensive/flammable "responses" to my original
post. These are being intentionally ignored as the best way of extinguishing
a flame is by depriving it the oxygen of reply before it spreads.

>Germany, etc)...

Monochrome is the only serious choice for most Atari professionals (yeah, there are some) mainly because you get a stable screen, less eyestrain and a greater resolution. And, mono monitors are very inexpensive.

That said, I agree with your comments on colour, as long as the display isn't going to give me a headache - I should be getting a SVGA RSN.

>resolution side? (i.e. how difficult would it be to have the choice
>of say "640x200, 640x400, 640x480, 800x600, 1024x768" etc?). Just
>curious...

It would be nice - but I don't seee how to do it. CBZONE is fixed at
1000x700 and I have no controll over that. To scale it exactly to other
resoutions require floating point calculations which are just too slow.
I've copped out by bit shifting the values down to 500x350. This has to
be done for *every* coord, *every* time it is used. Therefore anything more
complicated would slug the game even more.

OTOH If somebody does tell me of a good way around it, then I am quite
happy to have a go.

:-)

I'm thinking of picking up a used 1040 for some sequencing. I'm not sure which program to get. The 1040 comes with KCS, is it any good? Or should I get Cubase? Will 1 meg. of RAM be enough? Will I need more MIDI ports? (I've got 2 synths and a drum machine). Please reply via e-mail only. Thanks.

Glad to hear it works on the NOVAplus card - and yes it will work to some
degree in any resolution, as long as it has enough pixels.

>Almost works in colour too - they just don't do use the right VDI
>functions (using vro_cpyfm() rather than vrt_cpyfm(), I suspect).

Could you elaborate on this? I'm pretty sure I'm useing the vro_cpyfm(),
but didn't know of any alternative (will have to look at the source to make
sure though).

And how very true the above is also.

>Unfortunately, those programming for the English-native market just
>can't afford to ignore those low-res 640x200 color screens, because
>they comprise too much of the potential market.

This I only agree with to an extent. My reasoning for doing the CBZONE port
to mono was twofold.

1) CBZONE originally required a *minimum* of 1000x700 pixels. Dividing these
numbers in 2 gave a convenient fit for the 640x400 mode, which also most
importantly has a similar aspect ratio. The 640x200 has the wrong aspect
ratio (althoug I suppose I could have divided the y coords by 4 ;-) As for
320x200, I felt there just weren't enough pixels to do it justice.

2) I always work in mono and hate changing monitors just to test out colour
versions ;-)

BTW If CBZONE had been an original work by myself, it almost certainly would have run in 320x200 as well as 640x400 as I would have designed it to do so. As it is - I had much less control over it.

Roland.

] Fair comment. I urge ST users to get a monochrome monitor. 640*200 is such
] a stupid mode I can't see why you bother.

Technology gave us color display capability, why revert to such primitive
things as black & white graphics! :)

I don't have the desk-space for a mono' monitor, and nothing I use _needs_
one, and the small amount of mono only software I might want to use
doesn't justify the cost to me (being somewhat low on funds doesn't
help!)

Anything less than 640*480 is a stupid mode, but as my machine can't
handle that as-is, I have to put up with 640*200 which does everything
I use the machine for! (Except for those programs requiring ST-Low!)

I saw a TV commercial for CD32 in North America! It's that rather slick European made TV Commercial with the scientists and alien thing. It was on TV here in Toronto, Canada at some time around midnight and showed a local dealers number at the end. Neat. Actual advertising for CD32, in North America! I was exceedingly surprised and I might say shocked to see it. Some Commodore official who gave a speech at the World Of Commodore in Toronto said that the commercial definitely wouldn't be shown here because they didn't have the budget. So, I assume the dealer payed for it since they showed the dealers number.

adam

P.S. Commodore may not be advertising CD32 yet but someone is! :->

Yes, it's the same Insignia. SoftPC works fine albeit slowley on a Falcon
and a bit quicker on a TT. You still get the GEM menu bar & accs available
as the emulator runs in a window. Full support of multiple HDs, each held
as a single file - same as SoftPC on Unix. PC mouse & serial ports can be
configured too.

>If so, I wouldn't consider it such a great loss. With my experience using
>SoftPC on a 33MHz 040, it's quite compatible but STILL far too slow to be
>usable for anything but only occasional DOS/Windoze apps and it only
>emulates a 286 chip at that. On a 25MHz 030, it's painfully slow!
Sounds about right. It emulates a 286 on the Atari range too.

I don't want to start any blasphemous rumours,

3830. Screen Capture Software

Newsgroup: comp.sys.atari.st
Date: 1994-02-26 10:23:02 UTC
From: aspect@cats.ucsc.edu
Message-ID: <2kn7u6$16o@darkstar.UCSC.EDU>
Source record: 192187

I know irt's been asked before, but where can I find a good PD/SHareware program for capturing screenshots from the Falcon? It needs to save in any reasolution, and preferably in 256 colors (i.e. save to GIF, not PI* or .NEO) Working with extended resolutions and the Crazy Dots card on a MegaSTE would be a big plus.

~Chris

Wow! A _flame_ against a CPU that doesn't suggest using something else!
What a pointless waste of bandwidth.

> First of all, we have to remember that in spite of being made by
> Moto (traitor! ;-) the original design is IBM, ergo - garbage by
> definition, particularly in the areas of software and hardware.
> Other than that, it's OK... :-)

Yes, IBM's hardware is much worse than Atari's... I'd certainly rather
have my ST instead of a zippy RS/6000... The POWER-2 architecture is
the fastest single-processor RISC design available, isn't it?

> When it comes to instructions PPC (PowerPC) is a mess! As I wrote in

> with 200+ instructions a "risc".

RISC has nothing to do with the actual number of opcodes in a system.
Since PPC has 38 unimplemented POWER instructions, does that mean the
POWER CPU has _more_ instructions? No one disputes the fact that it's a
RISC system.

> On the hardware side the PPC looks impressive for about an attosecond.
> True, 601/3/4 have the 88110 bus (Moto's own Risc) but 620 (and presumably
> up) have a different bus. In "true blue" tradition the processor is

So, you want to cripple future speed for a compaitble bus? Sounds like
you want an Intel box to me...

> Hopefully this will help cut down on PPC salivation. Please send flames
> to advocacy (I don't read it) otherwise they will be gleefully ignore.

Give it's price and performance, I think PowerPC is an excellent
alternative to the crap coming out of Intel, and the expensive Sparc,
the too-fast-for-a-bus Alpha, the MIPS (personally, I'd like to see a
cheap MIPS box of some sort... some of those chips go for < $50!), etc.

At first, it probably sounds like a good idea, but so far, Atari's completely ignored the what, 3-4?, grass-roots support user groups that have popped up (and vanished) over the years. I think Atari United! is the only group still active.

Atari clones probably couldn't compete with DOS clones. The computer-buying public are generally 100% ignorant; they only know "I wanna run WordPerfect 5.2, since it took me over a month to learn it!" They could really care less about easy to use, etc. They want cheap, and they want to run the really crappy programs they already know how to use.

> Atari is good at coming up with new, fairly innovative computers. So why not
> stick to R&D and have someone else market, produce and service Ataris? Go
> with your strengths.

Are they really? IMHO, the ST was the last innovative computer to come
out of Atari:

STe - ST with slightly better graphics/sound to compete better with
Amiga 500
TT030 - very fast STe
MegaSTe - slightly faster STe
Falcon - faster STe with improved graphics, and MUCH improved sound;
including the DSP in such a cheap machine was an innovation,
but it was quickly eclipsed by Apple releasing similar machines
with better performance for about the same price.

Now, all the Jaguar fans will start to froth and say how innovative it
is... but hey, if it doesn't have a keyboard, it's not a computer. I
haven't seen any word processors, or compilers, or whatever that run on
the Jaguar (which is just an STe with MUCH improved graphics and sound).

Atari _used_ to be good at producing cheap computers that did just as
much as more expensive computers; they had the first 1M computer for
under $1k US. These days, they're not good at anything.

Flame away.

donm@ucon.gun.de (Don Maple) writes:
]
]Hi Gregg,

Gregg isn't an Atarian and doesn't read this newsgroup. He's an electrical engineer working on PowerPC development on the Motorola side of the joint development team (Moto/IBM/Apple). He's out of town at the moment on business, but I'll forward your response to him so he will have it in his mailbox when he returns.

]I'll try to keep this brief to save bandwith. After all this is an Atari
]conference. If/When Atari comes out with a PPC-based machine it might be
]more appropriate to extrapolate in more detail.

True, but all the speculation on this newsgroup re: the PowerPC indicates a real interest in possible futures for Atari that might include the PowerPC. I believe it is appropriate to discuss it here, as long as we keep a meaningful Subject: line so those not interested can easily skip over our articles.

]> Well, he does have a few valid points, but in general I think he's
]> just blowing his horn.
]
]Thanks for acknowledging them although when it comes to "horn blowing"
]as I freelancer I have no horn to blow. I call 'em as I see 'em. However,
]to put things in perspective, you yourself have a horn (considering your
]involvement) but since it's Moto you're being loyal to all is forgiven :-)
]because...

I believe you ARE "blowing your horn", as Gregg puts it, as Gregg is. Both of you are vocal in the defense of your opinions, and there's nothing wrong with that. This line of discussion ought to help all of us sort out the facts and make up our own minds.

]> The PowerPC instruction set is
]> a subset of even the 601 instruction set. Therefore, the 601 has
]> several instructions that are not part of the official PowerPC
]> instruction set.
]
]Exactly. And that's my point. I'm yet to see an IBM product where
]marketing was not the prime design prerequisite often (always?) going
]against technical requirements.

I've yet to see ANY major company where company politics and marketing policy didn't intrude into techical considerations. It's a fact of life. Companies are made up of people, and people play politics,

even those of us who claim to HATE politics. Companies also have to market their products to survive. Has IBM done worse at balancing these conflicting needs than most lately? I believe so, but it's a matter of degree, and I do believe they are getting better. There are factions within IBM who are truly dedicated to technical excellence, even while the rest of the company is making some really dumb moves. Don't view IBM as a monolith wherein all the parts think and act identically. The PowerPC team has not been immune to mistakes, but I believe they are doing much better than IBM as a whole.

No, I don't work for IBM; I work for a major competitor. FWIW, we long ago converted our entire product line over to RISC, and are using the MIPS line of processors, also an excellent product (IMHO).

]Correct again. You have therefore confirmed all of my statements.

I don't think you and Gregg disagree on the facts, only in how to interpret what they mean to the user.

]A lot of people seem to have suspended
]their critical faculties and bought into this marketing ploy.

A lot of people will buy into any well-presented marketing ploy. Why do you think General Motors continues to be the largest purveyor of motorcars in this country? In the last couple of years their products have begun to come around and some are now quite competitive with the best in their class. but by all rights GM SHOULD have died in the late '80s from an inability to sell nearly all of their products. Marketing and a massive dealership network carried them through (along with the inertia of people who will buy the brands they've always bought regardless of how they compare to the competition). [If you are a big GM fan and want to start a flame war over this, do it in e-mail. This was an illustration, not a change of subject.]

]> Sometimes to make a quantum leap in performance, you have to
]> break from the past.
]
]Bingo! Like abandon the unholy trinity of IBM/Intel/Microsoft... :-)

I don't think you have to work very hard to sell THAT position to a bunch of Atarians. :-)

]But seriously, why bother with the corrupt past at all? Why not make
]a clean break and the same type of leap as when the 68000 was introduced?
]Why anchor yourself (Moto, I mean) to R6000 (a niche market at best) in the
]first place?

Because Moto doesn't believe it will be a niche market. I happen to agree with them.

MultiTOS's major speed problem is all the busy-waiting the AES does; run
'top' and you'll see the AES taking 50% of the CPU time! This _really_
hurts on an ST... it'd probably be ok on a MegaSTe with NVDI though.

I think that the problem may be that there are too many users
connected when you try to log on. Atari archive is VERY busy.
At the login just type ANONYMOUS and at the password just type
in your e-mail address. Should work. Try a less busy site to
see if you can connect. FTP.FUNET.FI is good and has some good
ST software.

Paper white high res b&w graphics. The fact is that a 70Hz paper white mono monitor causes less eyestrain than a 50/60Hz color unit over long periods of time (this is totally ignoring the higher resolution of the mono monitor). In my case, I modem to work at least 3 hours a day, sometimes much longer. Also, DTP and Mac emulation are greatly enhanced (if not made feasible) by low emission high res graphics.

I used my Mega2 with only a color monitor for a couple of years, and I will _never_ be without mono monitors again for as long as I use my STs.

> I don't have the desk-space for a mono' monitor, and nothing I use _needs_
> one, and the small amount of mono only software I might want to use
> doesn't justify the cost to me (being somewhat low on funds doesn't
> help!)

Sounds like you don't need one. My point is that others feel differently for valid reasons. Also, I suspect that if you actually used a mono monitor for a few days, you would be a convert (I know I was!). Mono monitors run $50-$100 used. I would hazzard that a mono monitor is way up there in terms of "Productivity enhancing accessories", in that you can simply stare at it for a lot longer without discomfort (again, discounting the higher resolution, which is also a significant feature). I would place the purchase of a mono monitor right after the purchase of a hard drive, in terms of getting more out of your system. Just my $0.02.

I have heard conflicting info about the audio outs.
Is there really a bass boost???
Does the Falcon require some hardware modifications before the
outputs can be run into a mixer (a Mackie 1604, for example) ???

Given that you are spelling anonymous correctly (you seem to be :-) I would
guess that you are trying to access the archive when all available user
slots are full. There should be a message printed that states this, something
like "All allowed connections are being used at this time". If you like,
capture exactly what happens when you try and email it to me.

I created 4 partitions of 512MB each with hdx, and ahdi was able to handle
those partitions. When I moved the harddisk from the Falcon to the TT
there was a problem: the Gemdos in TOS 3.06 cannot handle the 16Kb
clustersize, it crashes.

In my continuing (and probably fruitless) quest to obtain an ST Book, I've learned that the Books were only distributed in Europe. And so I turn to our European readership for assistance. Can any of you put me in touch with an Atari dealer that has, or might have, or might be able to get, an ST Book? An email address would be ideal, a snail mail address is good (particularly if it comes with a primer on sending international mail), and a phone number is also workable (with the proviso that the only non-English language I speak is Spanish, and that not well). Thanks in advance.

cherborth@semprini.waterloo-rdp.on.ca (Chris Herborth) writes:
]
]So, you want to cripple future speed for a compaitble bus? Sounds like
]you want an Intel box to me...

It read kinda like that to me, too, but later posts from Don indicate
that not to be his real intent. I think he's worried that switching
over to a 60x PowerPC would be a major paradigm shift, to be followed
immediately by yet another to get to the 620. I think the issue here
is whether the jump from the 60x to the 620 is really such a shift.
I'm no expert, but I suspect that the jump from the 60x to the 620
will be similar to that from the 68000 in the ST to the 68030 in the
Falcon, not like the jump from the 68030 to the 60x.

]Give it's price and performance, I think PowerPC is an excellent
]alternative to the crap coming out of Intel, and the expensive Sparc,
]the too-fast-for-a-bus Alpha, the MIPS (personally, I'd like to see a
]cheap MIPS box of some sort... some of those chips go for < $50!), etc.

You want a MIPS box? Have I got a deal for you! We happen to have on
sale today our cheapest MIPS PC: only $5000. (I'm at least semi-serious
in that we do sell a MIPS PC for about that. I'm in design engineering,
not marketing, so I can't quote exact prices. It's considerably higher
than a Falcon030, though; I can assure you of that. It's also twice
what the cheapest PowerMac will be in a few short weeks.)

Does anybody know anything about the quality of the sound editing
modules included (or so I thought) with either Cubase Audio or NL Audio
(if it has been released yet.)

3862. US Robotics 14.4K Modem help!

Newsgroup: comp.sys.atari.st
Date: 1994-02-26 22:19:11 UTC
From: automan@u.washington.edu
Message-ID: <2kohsv$p5n@news.u.washington.edu>
Source record: 192118

I recently acquired a U.S. Robotics Modem, 14.4 k baud w/FAX.

I have trouble using it on local BBS's (Like FOREM).

What happens is that I log-on at 19.2 baud and after 5-9 minutes, the modem simply drops carrier.

This does not seem to happen when I use the dial-in facility to get here.
Also, sometimes during upload/download, the speed seems to drop real low.

My set up:
Atari 1040Ste w/TOS 1.6 (I think)
Modem mentioned above
Using ANSITERM (no modem init string used)
No Patch for RTS (I have this on....through control panel, is this bad?)

Any help would be appreciated!

Thanks in advance,

Roger McGhee (automan@stein.u.washington.edu)

P.S. IS there any FAX software out there for the ST?

> but it was quickly eclipsed by Apple releasing similar machines
> with better performance for about the same price.

Not exactly true. The Falcon vs Mac argument is that Apple released machines costing less than the Falcon that have the same graphics capabilities as it. The Apple machines that can completely match the Falcon (The AV nes) are still much more expensive. Thew Falcon is still the least expensive machine on the market with an integrated DSP.

>Atari _used_ to be good at producing cheap computers that did just as
>much as more expensive computers; they had the first 1M computer for
>under $1k US. These days, they're not good at anything.

In you opinion, of course. I happen to still believe that they are good at making computers... Plaing around with all the neat stuff I can do on my Falcon last night made me refall in love with it. :) P.S. Thwe falcon WILL probably get a ention in computing history as the first machine with integrated DSP to be avail (in the unisusable 1/0 config) for under $1000.

As informed by a more careful reader via email, your problem is that you
are using telnet. You should use the command "ftp atari.archive.umich.edu".
Before getting any files, you must set binary mode (type "bin"). There is
an ftp guide periodically posted to this group, which would probably be
of use to you.

3870. HP DeskJet 500 on 1040ST?

Newsgroup: comp.sys.atari.st
Date: 1994-02-27 00:30:37 UTC
From: hakanson@bogart.cse.ogi.edu
Message-ID: <2kopjd$9i9@reuter.cse.ogi.edu>
Source record: 192126

Greetings folks,

I want to be able to use my newfangled HP DeskJet 500 on my oldfangled 1040ST. Just printing out plain ASCII text would be sufficient, but I currently can't even do that. The ST seems to think the DJ isn't there, though I'm using the same Centronics cable that works fine with my old Epson-clone dot matrix printer.

I've made a quick stab at a printer driver for 1stWord, but with the above problem haven't been able to test it -- the ST just thinks the printer isn't responding. Surely someone else has done this already....

I'm well able to FTP all over the place, but would appreciate pointers from someone who knows what to retrieve. Please respond by email if possible, and I'll summarize the replies here. Thanks.

Its fine on a MSTE with NVDI. The trick is to lower the priority of the
AES so that when another program is started the AES has to give up some
of its CPU time to it. The main problem being that the AES is often the
parent of a process - and child processes inherit the priority of there
parents. Careful use of 'TOP' is normally then required.

:-)

Roland.

3874. Another newbie question re: terminals

Does anyone know of a terminal program that will run as desktop accessory
like the VT52 thing but with VT-100 emulation??? It doesn't have to be
fancy or offer file tranfers or anything just a simple VT-100 terminal I
can pull down as a desktop accessory for the ST.

Yes there's fax software available. STraight Fax from Toad Computers amongst other dealers which handle it is considered ther standard. I used the older version for years & recently had to send away for the upgrade which is specifically for class 1 modems - like USR. AQs a new 21.6 DS owner, I had to upgrade to be able to use its class 1 fax.

Now just where DID I park my hard drive?

These aren't from me, but a quick mention of some of these large-ish
Games recently uploaded to atari.archive.umich.edu (and probably others)

Battle.LZH - A 1 or 2 player game of tetris (2 player is via null-modem)
Has DMA sound.
Shocker2.ZIP - A very good puzzle game, for 640*400 monochrome.
In German and English (Docs and binaries), also has a seperate
Falcon and TT version
Killtime.lzh - Killing Time, a pretty simple STOS game involving clicking
on the people very quickly and throwing rocks at them....

a while ago:/

conquest.lzh(zip?) - A very good conversion of Strategic Conquest,
World domination game, complete with quite accurate world map.
Runs under MTOS and will apparently run in any 16 color or better
mode!

In a message of <24 Feb 94 04:14:04>, Niki Hemmings (1:286/2) writes:

NH> Funny, I thought the DSP executed instructions in 2 clock cycles,
NH> so 3*32/2 = 48 MIPS. At least, that's what it says in the DSP User
NH> manual.

If you read farther in the User manual you'll find that it says
something to the effect that due to the highly parallel nature of the chip and
the internal Harvard architecture, it can have as many as 3
instructions at once in various stages of execution, and can effectively kick
out one instruction per clock, even though it takes two clocks to execute each
instruction. Obviously, certain requirements have to be met, since you are
talking about taking advantage of the pipelining in the chip.

Later,
Gizmo@dswhq.omahug.org

Proper VDI calls should allow the program to 'see' what resolution
the computer is being run in, and then allow for the program to utilize
the screen dimensions for drawing.

I wanted to point out that you dont need the full Atari dev kit
to get ahold of all this stuff, Scott Sanders book is available
separately from the full docs. I am not a big programmer, but having
the book nearby has allowed me to solve others quandries.

If you are looking to get back into the picture there IS help.

I would suggest you find back issues of Atari Explorer Online, they should be on an FTP site somewhere, or they are on Delphi and GEnie.

NEXT, if you are looking for CAD stuff, Lexicor as well as a few others have software to take advantage of the CAD 3D file format.

Call STeve's Software at 1-800-487-7753 and he should help you in your software quest.

In the DC area (marlyand I belive) Toad Computer is a wonderful place to visit, they are an Atari dealer and VERY highly reccomended. I do not have thier address/phone offhand.

If you have any specific questions feel free to EMAIL me!

I must say that for a usenet discussion, this one is remarkably salient!

I would like to see the possibility of a PowerPC chip with the PCI motherboard.

That would allow for a better 'independent' platform than anything dreamed of in Intel/Microsoft/IBM/Moto's collective corporate imagination!

"Most license agreements that come with the software you
purchase prevent you from modifying that software."

Whether I personally pay any attention to the license agreement depends on whether: (a) I was allowed to read it before purchasing, or at least opening the software. [In other words, if I find I am stuck with supposedly abiding by their agreement only after I have spent my money, and I cannot return the software, I do not consider the agreement legally binding. If the company disagrees with my view, they are welcome to attempt a legal solution]. (b) It attempts to override any portion of the copyright law [i.e., forbidding any backups, forbidding necessary modifications to make it run on my machine, etc.].

Dongles may seem inoffensive, but the first time you lose one (and have to pay for a new one, provided the company will sell you another), or the company goes out of business and you find you can't use the program on a newer machine only because the dongle won't fit/work, you can see the pain they cause the legitimate user. No copy protection is "painless"...some forms are simply more tolerable than others.

As to your suggestion to avoid buying such software if one objects to protection...many do this. Using a non-ST example, many Amiga owners would love to have the new paint program "Brilliance" but will not buy it due to the dongle-protection. I suspect if you ask people who did buy the program if they would have paid more to not have to worry about the dongle, the answer would be "yes".

In this case, (and in the case of Cubase), this hurts more than with a game, because these are tools that can be expected to have a much longer life, rather than something that can be "played out".

I don't pirate. However, I would de-protect any dongled software I had in a minute (I only have one...a term program for my C-128) if I had the means. Likewise the same for any software-protected utility, productivity software or OS (as GEOS for the 64/128 is protected).

3900. Falcon/'040 board

Newsgroup: comp.sys.atari.st
Date: 1994-02-27 15:58:52 UTC
From: sjg@phlim.ph.kcl.ac.uk
Message-ID: <1994Feb27.155852.2316@bay.cc.kcl.ac.uk>
Source record: 192057
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

Well, I rang system solutions yesterday (Saturday), and asked them about the "afterburner" '040 board. He said they were looking at 3 different '040 boards for the Falcon at the moment (!)

I mentioned price, and he said that wasn't decided, but then I said "Well, MAC '040 boards are around #1500 aren't they", and he said it oughtn't be that much for the board. (He said he liked the easy way you can upgrade the processor in the Falcon as well. Strange, I thought it was difficult, esp. since an '040 *must* be on a 32-bit bus...)

Oh yes, he mentioned that one of the boards was based around the Medusa system...

Still, Falcon/210Mb HD/32MHz 040/SVGA monitor/Blow-Up ought to cost around #2300 all in (assuming '040 costs around #1000). Better deal than the Amiga '040 at any rate :-)

Simon.

Where is all this dsp software onthe Falcon? The Falcon with harddrive is about $500 less than the cheapest AV Mac(Quadra 660 AV 8/230 =$1700). But remember that AV Mac has a 040, more memory and HD space and is supported and backed by a company that is Tramiel less.

Remember Simon that probably what they'll do is what other people
have done in the Amiga. Put some memory directly accesible in the
expansion for the '040 and then some logic to access the other
memory stuff... Although it slows down accesing the internal Falcon
stuff, it will still be really fast.

>Atari is good at coming up with new, fairly innovative computers. So why not

Atari hasn't come out with an innovative computer since the ST. All computers after the ST may have been current in terms of audio, but were far behind in video.

Nothing about the Falcon is innovative. The NeXT cube did all the Falcon does and more 4 years before the Falcon was released.

3904. I got a TT yesterday- Need suggestions

Newsgroup: comp.sys.atari.st
Date: 1994-02-27 17:27:16 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <CLw8HH.F35@watserv2.uwaterloo.ca>
Source record: 192061
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am soooo happy, I got a TT yesterday used for $1100 (canadian). It seems to be fine. Now, the questions:

1. It has TOS 3.01. I am getting the 3.06 ROMs (I don't know how long that will take) so does anyone one know a complete list of Tos fixes I should install till then? (Besides serial port stuff, I have HSMODA02)

2. Does anyone know of any TSR's or accessories I should avoid at all costs. I have my accesories in a folder called ACCs and am using ACC v1.3 (when not using Geneva) to have the desktop find them. This runs perfect on my Mega STe (TOS 2.05) but doesn't work at all on the TT. Anyone know of a similar program that will?

3. I don't want to boot off the internal drive! It's too damn slow! For now I hook up my external drives which the TT will boot from because the internal drive hasn't spun up when it is ready to boot. On resets, I have the ICD pro 6.2.0 utils on both SCSI 0 and ACSI 0 set up to ignore the internal drive (ACSI ID 8 to ICD). I guess the best solution is to take my Quantum from my external case and put it in the TT case and take the Seagate 48meg from the TT case and put it external. I assume the TT SCSI stuff requires disabled parity as well? Does any forsee any trouble this might bring?

4. Spectre is really nice on the TT (I just thought I'd throw that in) I hope 3.1 comes out real soon.

5. It has a low density drive. I assume in needs an AJAX chip to support HD. Is there anything else it needs for this (besides TOS 3.06) like jumper changes, traces cut, etc?

6. Any wanna buy a Mega STe with 4meg and no shifter chip problems (It was fixed by Atari Canada - 1040Ste shifter installed)? TOS 2.05 and low density drive and NO Hard disk. Also an SM124 mono monitor (the old ones, really crisp) Make me an offer. I will consider trade+money for a 1040Ste with 4 meg and no DMA problems. (A friend of mine wants a 1040STe)

7. I'm gonna need TT RAM soon. Everyone seems to recommend GE-Soft board. Anyone have any recommendations/caveats?

Thank you in advance! Please e-mail or post, I read the news fairly frequently.

Yeah, I expected that, what I meant was that the '030 has only 16 data lines to it, so presumably they'll have to bridge from the co-pro slot (not a problem, I suppose), but this doesn't reall make for "an easy processor upgrade" ...)

The other Falcon memory will be still @16MHz anyway, I expect, so that'll be slow as .... but like you say, I'd expect the thing to go like greased lightning, compared to my 8MHz STe :-)))))

Simon.

[...]

I recommend to use a RTS/CTS-patch. Also TOS 1.6 does not support RTS/CTS
correctly - but this is very important to use high-speed-modems above
2400 bps !

HSMODA02 is a nice patch wich also replaces the slow BIOS-transfer-
functions.

Ciao, Arno

The Jaguar isn't released officialy in Europe (start: 15. March 94), but in Germany most games magazines have reviews of Jaguar games and also reviewd the machine, without getting any support from Atari Europe/Germany.

I'm still amazed how Commodore can sell a videogame like CD32, everybody want's a better and faster machine, evrybody want's more colors (than 256), everybody want's the technology of tomorrow, and many freaks buy CD32. I can't underdstand it.

>but are impressed with CD32. Cool!

Hmmm, many companies are developing new videogamesystems: SEGA, NINTENDO, SONY, NEC, ATARI. They all have one thing together: they want to do a extremly powerfull machine using high-perfmormance RISC processors (20 MIPS and more), DSP's, highspeed-graphicprocessors, 16 bit CD quality sound, 16.7 Mio colours, etc. Yeah, even Atari they talked about a faster Jaguar II (40-50 Mhz). And you'll think that the CD32 with max. of 256 colours, a 68020 processor with 2.5 MIPS, the old amiga-sound-system, an the old blitter is cool ? I hear you say: But the CD32 can display 16.7 Mio. colours simultanously ! Yes it can, but then there is nearly 0% processortime left for other tasks. The CD32 has a databus of about 7 MB/s the Jag has a maximum transferrate of 106.4 MB, so even extremly fast games in 16.7 Mio colour mode are possible and done. Don't expect to see games like Cybermorph, Alien vs. Predator or Doom on the CD32, the Amiga/CD32 is to slow.
You know wahts positive on the CD32 ? There are lot's of Amiga user buying games, and so lot's of games are produced. It's easy to convert them to the CD32 because there is just not much difference between the A500 and the CD32 or the A1200 and the CD32 (only difference is the CD and no keboard and floppy with the last...).

In DIE HARD GAME FAN you could read that:

1993 MEGAWARDS:

'93s BIGGEST DISAPPOINTMENTS
Skid: Amiga's lifeless CD32
Kid Fantastic: 3DO's gameless launch

And in the ZOOL (CD32) review:

"This so-called 32-bit system is really starting to annoy me. ... After playing ZOOL, I am convinced this system is nothing to get excited about."

You ftp to get files via anonymous access, you telnet to log on as a
user; for ftp, if it's set up as a server, you don't need an account,
for telnet you do, just like on your local machine.

Much, much more expensive, not for sale yet (well, it's sampling I
think, but that's about it), there aren't any computers built around it
yet, and it's probably about as fast as Intel's "Pentium". It probably
won't be very successful, especially with the PowerPC 601 already
shipping commercially...

Yes, no real data... ;-)

Um, the Jaguar's CPU (well, one of them, anyway) is a 13Mhz 68000;
barely an improvement over the original ST for a general-purpose
computer, but quite adequate for a game console.

> Intel 80x86 based machines before MS Windows was available. Unfortunately
> Apple sued DRI over the trash can, and severely crippled the future of DRI's

Um, no. GEM is what DRI developed, and I think a crappy version of GEM
for Intel is still available. Ventura Publisher was the flagship GEM
app for quite some time...

Just FYI.

Could it be because you can't buy on in Canada, you have to mail-order
it from the 'states? Or from stores that have done this and are selling
it to you on the 'grey' market?

Hmm, I suppose the Falcon isn't really available in most of Canada,
either. :-(

```
CONNECT Magazine Offers Special Subscription Rate for BBS Sysops
================================================================

OK. You've heard about CONNECT, possibly even picked up copies of the
magazine at your local newsstand, bookstore or computer dealer. Maybe
you've seen our advertising in books such as the "Whole Earth Online
Almanac," or you saw the mention of CONNECT in the December 6, 1993
issue of U.S. News & World Report. Or maybe you've just heard about the
magazine from talk on the commercial online services, or seen the
CONNECT Online BBS Edition door on a local BBS.

But, you still haven't subscribed. As a BBS sysop, perhaps you've just
been too busy keeping your system in peak shape. And maybe you've also
been thinking about advertising your BBS via CONNECT's International
BBS Listing or Service Ads.

Well, we're making you an offer that'll save you money *AND* give your
BBS some added international exposure.

To receive details and the necessary form, email your request to
me at pegasus@cyberspace.org. Thank you!

But the programs we've been talking about do all *support* both of these
modes, they just work to different levels of quality.

It's a big shame that mono monitors aren't more prevalent in the US since
serious users without them are *really* missing out. Some software like
Calamus, for instance, will only work in hi-res (before someone jumps in,
we're talking standard ST's without graphics cards here) and there is a
valid reason for this. Calamus in medium res would be almost entirely
unusable.

Depends on what you do - the 1400 KB/s Maxtor drive will do, unless you have repeated use of very short audio bits. This is where the really fast drives are required.

Remember: Cubase doesn't require any special drive. It will just fail to replay things that are too complex for the drive currently in use.

bye, Peter

Simpler - the author of the HSMODxxx drivers designed a DIY serial port expansion for all STs, containing FIFOed ESCC chips superior to those in TTs and Falcon030s. Drivers are in the HSMODxxx package.

>P.S. IS there any FAX software out there for the ST?

It seems to me you have a noisy line.

I guess this because my Sportster never just drop carrier unless someone picks up the phone or the call-waiting beeps and hangs me up. If this is your problem, you can disable call waiting with *70 on a touch-tone phone. The other reason I think this could be your problem is that your xfer rates drop. The Sportster (as well as other v32bis modems) will lower its baud rate with a noisy line until it reaches a speed where no errors occur.

As for FAX software, Straight FAX is supposed to be the best FAX software for the ST. If you buy it, make sure you get the one made for the USRobtics Sportster, as it seems to have some strangeness to it when it comes to faxing.

You might also want to try other software to see if it makes any difference. I may get flames for this, but Ansiterm has always seemed a little flakey to me. Try Connect or the Freeze Dried demo. Both of these are Shareware.

Actualy, the lowest 040 board in the Mac market is from Mobius Technologies.
25mhz with out FPU is $399 and with fpu is $499
33mhz with out fpu is $499 and with fpu is $799

Than again, you can get a new(!) Quadra 605 4/80 with KB for $900

On March 14 Apple will intro and sell their PDS Power PC upgrade for $699 that blows away the 040 boards.

```

I have TOS 1.2 and I have found several problems. I, however, have resolved them.

1) On files that don't uncompress all of the way, Just uncompress them again. LHarc is weird, about 80% of the time it works, 20%, it doesn't. If, one file doesn't uncompress, delete all the others in the archive. Delete works great!

2) Bombs bombs bombs! When extracting a file, you MUST extract all of the files. Don't select certain files. If you only want a couple, delete the others in the archive.

I hope this helps.

3931. Atari in Ireland ?

Newsgroup: comp.sys.atari.st
Date: 1994-02-27 22:18:06 UTC
From: akeady@nmrc.ucc.ie
Message-ID: <CLwLy7.63@nmrc.ucc.ie>
Source record: 192088

Hi,
Does anyone out there know if there are any Atari dealers left in Ireland ?

I have an ST and want to upgrade to a Falcon but have yet to see one - according to one shop that used to sell Ataris, the distributors/importers no longer import them. They reckoned that music shops were the only possible sources.

So, anybody know a shop selling Falcons (location not too important) or is mail order the only way of avoiding becoming a PC clone ?

Thanks,
Aidan.

>one? If not, why not write to Insignia and encourage them to
>release it? If anyone agrees and knows their address please
>post it.
I'd very surprised if this worked because a) Atari alegedly backed out the
deal owing Insignia cash, b) Atari own 1/2 of SoftPC even despite a). Also,
it is over 2 years old now and totally out of date with the current SoftPC.
Thus even if they did release it, it's almost certain it will never be
updated as it would be a massive effort to catch up. Also, it was
originally intended as a 200GBP product. It's the same speed as 55GBP
hardware emulators if not much slower.

:>On March 14 Apple will intro and sell their PDS Power PC upgrade for $699 that
:>blows away the 040 boards.

Indeed it does.

:>Peter Sinclair-Day
:>University of Northern Iowa
:>Cedar Falls, Iowa USA
:>Commodore Amiga and Atari Corp will be crushed by the Power PC!!

While the Power PC indeed has a lot of power, it is marketed by Apple,
REAL computer users (i.e. Unix/real OS users) do not like Apple, because
like it or not Apple computers are for stupid people !! U can say what
you like to this, but real users find the apple GUI gets in the way
of what they want to achieve. (Sorry to make such generalistions but
its true).

It will sell well though, I'm glad too, because the processor architecture
is very good - a giant leap for PC kind..... (all it needs now is a decent
OS!)

This crazy system that my dealer is letting me borrow has 6 Mbytes of memory. When I load all of my desk accessories and TSR's I still have about 5,500,000 bytes of RAM free. Unfortunately 2 Mbytes is ST RAM and 4 Mbytes is TT RAM. Can any program use both types of RAM at the same time? This system is called a SST030.

Your post makes AFS sound like it is only available on University computers.
But AFS (Andrew File System) is sold by the TransArc corporation. It offers
higher performance transfer rates than NFS does. It also offers Kerberos
authentication which is slightly more secure in NFS. In addition it offers
more of a VMS-like permission system for UNIX* filesystems. Last, it has
a global filesystem, which means data has the same path no matter which
site you use.

Sorry, but I don't know of any other AFS sites carrying Atari software.

From: molin@cxc1.cl.msu.edu
Message-ID: <2krvij$pdd@cxc1.cl.msu.edu>
Source record: 191959

I have two questions concerning Falcon030. The one in question has 14Meg, no internal hard drive. Fpatch2 and Bmapfix2 are both in AUTO.

1) No terminal program attempted to-date works properly until the system is rebooted. Outgoing keystrokes and dialer commands will get to the modem and then out to the host system, but nothing coming into the computer from the modem is displayed. Nothing. The system _MUST_ be warm or cold booted in order to use a comms package successfully. ANy ideas?

2) This particular computer seems to have a video shifting problem. When the system is booted, the Fuji logo and memory test are often times (90%+) indented from the left edge of the screen, sometimes as much as 3/8 inch. Regardless of distance offset, unless the mem-test starts at exactly the left edge of the screen, then my boot manager (X-Boot III) loses the right portion of its display, which is entirely unsatisfactory of course. Other people I know have reported similar video display shift problems, but nowhere near the frequency of this particular Falcon...

Where is it? try any archive site... I've got (without actually looking for
DSP related stuff) 2 JPEG viewers, 2 Fractal generation programs, and several
audio programs that do DSP effects. I'm sure if I actually went looking for
DSP software I'd find much more. Also, I jsut downloaded the Blowup demo,
and this Falcon sure looks nice in 800 x 600 with the addition of only a free
program! Imagine if this were a Mac, where they force 640 x 480 on a
14" or smaller monitor, where I'd have to buy a $600 17" monitor in iorder
to do higher resolutions! That and the fact that this stock falcon feels as
fast as a Mac with a 25 mhz 030 or faster... It's so nice to have a USEABLE
OS...

3958. Another G++ problem

Newsgroup: comp.sys.atari.st
Date: 1994-02-28 07:54:47 UTC
From: am136@FreeNet.Carleton.CA
Message-ID: <CLxCnB.27M@freenet.carleton.ca>
Source record: 191964

With the help of a couple of folk on this newsgroup, I finally got G++ to compile a "hello world!\n"-type program. Up until I downloaded a whole new set of utilities I had been getting a "Bogon alert" (of course!) and the resulting binary wouldn't run.. Anyway, in case anybody else is having similar problems, these are the files (available from atari.archive) which gave me a working setup:

gasbin04.zoo gcc258b.zoo gmlibo30.zoo incl97.zoo libolb95.zoo pmlolb21.zoo utlbin36.zoo

However, I still get warnings about _NFILE being redefined. G++'s stdio.h defines it as 32, and GCC's compiler.h defines it as 20. (The only file I am directly including in my program is iostream.h.)

Can anybody tell me what the correct definition of _NFILE is? (STE, 4Mb, TOS 1.6 in case it makes any difference.)

"I want to be able to use my newfangled HP DeskJet 500
on my oldfangled 1040ST. Just printing out plain ASCII
text would be sufficient, but I currently can't even do that."

Try changing your power up order. In other words, if you power up the
computer first, then the printer, try turning on the printer, and then
the computer. There is a more permanent solution to this problem,
involving a diode hack to the ST's parallel port or the cable itself, but
I do not have the docs on it.

Well the Atari Developer Docs says there is a bass boost built into the headphone output to 'compensate for the poor bass response of most headphones'. All I can say is WHY ???? I wanna use my Falcon for audiophile sound processing, not a bleedin' cheap personal stereo style bass-boost!

It's also quite noticable which is a shame...

Really smart ! What is the price of a NeXT Cube, even now? Please
compare what can be compared. The NeXT Cube isn't a personnal computer. It's a
workstation. BTW, I love this machine - the NeXT -. But, one must admit that the
Falcon is the first affordable personnal computer to include a DSP, and to have
a good/modern architecture - if we except this silly 16 bits bus and 16Mhz -
designed for that (in opposition to PCs, which have a crappy architecture, with
modern extension cards).

Has anyone tried the new Falcon only debugger by Black Scorpion yet ?
I saw an advert for it in a magazine the other day, and it looks to be
quite cool. But at 40 pounds UK, I want an opinion on it before I splurge
my cash.....

I could really do with a decent debugger for my f030 - I'm using
PeaceBug at the moment, but I don't really like it. I preferred
MONST, but the version I have buggers the screen real bad (both mode
lights come on at once on my SVGA monitor, and it whines major league).

Alternatively, does anyone know if the STCLUB's Xdebug program works
on a Falcon ?

You might be able to find a copy of STalker 1 somewhere, I seem to
remember that this was released as shareware/PD several years ago - I know
I saw and used a copy for a short time. As for where you'd get it - sorry,
can't help.

From: ogal@cix.compulink.co.uk
Message-ID: <CLxqvv.IAw@cix.compulink.co.uk>
Source record: 191982

Hello all,

I am trying to buy a Hebrew Speedo font. So far all my attempts to find a font in the UK have failed. I rememeber someone mentioning that there is a Postscipt or Truetype to Speedo convertor on the PC. I can get hold of PS or Truetype fonts, so maybe someone here knows of a way to convert it to Speedo.

Sorry Mr Boyd, but without sounding rude, I have to tell you that you are wrong
on this one.

The word to look out for was telnet. You can only anonymous login via ftp (or
fsp). Telnet requires you to have user access on the other end.

Hope this solves the original problem.

Well, it was real simple for me. I have two ST systems in my house, one for me (MIDI, WP, finance, logging onto the VAX at work) and one for my kids. They outgrew the software we had and I couldn't find any software for their age group. So I bought them a Mac and moved my WP and finance tasks to that platform as well. Now my 1040 is used only for MIDI and logging on, the 520 is still in use by my 6 year old. But there is no future on the Atari platform for *my* use.

It seems to me that the only remaining niches for Atari are pretty specialized: MIDI, DTP (maybe). The ONLY thing that can ever revive Atari is software support and lots of it. Maybe I'm from the old school, but my rule is: pick the software you want then buy the computer that runs that software.

I still like my 1040 and will use it until it dies, but I'm really just one more person who's left the Atari fold. I'm surprised that they even bother trying to sell Falcons in the US. A lot of this talk about the future of Atari is kind of silly; either they will prosper and offer cool new machines or they won't. In the meantime, let's just get real and remember it's *only a computer*, a tool to get stuff done.

Multiwriter is the commercial successor to ST writer Elite. It is not made by Atari but by someone else. (can't remember who. it's in an older AEO or Z-NET (93)) While ST writer does not work under Multitos, Multiwriter will and will also import a range of file formats. It is not wysiwyg like e.g. Wordflair and will only use the built-in fonts of your printer. As far as I know there is an international version (many languages including of course American (don't know if English).

What's happened is that Atari have rationalized the different European offices into Atari Europe, which is essentially Atari UK and Atari Holland. Frankly, Atari UK are the wrong choice (IMHO).

This is from a story in ST Review (so could be wrong).

3989. SH205 HardDisc Trouble. Help needed.

Newsgroup: comp.sys.atari.st
Date: 1994-02-28 15:06:08 UTC
From: Ronald.Hartwig@arbi.informatik.uni-oldenburg.de
Message-ID: <1994Feb28.153929.26706@arbi.Informatik.Uni-Oldenburg.DE>
Source record: 191995

Hi,

some weeks ago I asked how to get around TOS error #34 (on my E:
partition). Some of you suggested some utilities to aid me. Thats what
happened:

I first tried STTOOL 1.8 on it. It messaged me: 'Orphan File found'
and asked me if it shoudl fix it. I got the report that everything
would be alright now. So I started 'Cleanup directory' on the root of
my E:-Partition. Now the (til then 100% correct) C: partition crashed.
26 entries with unlimited length appeared. It took me several hours to
get those entries out. Unfortunatly you could not open the Desktop
window for that partition any more as it crashed instantly.
At this time I had to recognize that my BackUp-Program 'HARDDISC
UTILITY V.2.0 FROM APPL. SYSTEMS HEIDELBERG' on which I stupidly
relied on 'til then simply denied any access to any floppy disc. (this
was the first time I really wished Volker Christen who dared to write
the BackUp-System would disappear into the Nirvana).. yeah that was
really Murphy-like.
As a careful person I had made a second backup with an lzh-program
(V2.01, Yoshi Quester I think) but that was exactly the program which
put this error #34 on my disc, so that got the second person on my
personal Go-To-Hell-List and I had to try on to fix the disc without
reformatting and the struggle continued...

no, I won't bore you any longer with details (I simply cannot
remember those details any more)..

Finally I managed to get the C:partition going again and the
original TOS#34 error disappeared too, but there still seems to be an error
on my E: partition, funny enough three different programs report
three errors:

CHDSK3 : 6 Alert-Boxes whicgh warn because of defect Data on
DRive E: and a final report stating 'Lost Cluster: 1 [RECOVER]
153F'. When I try to fix it with the [RECOVER] -Option it still
remains lost but the C: Drive gets damaged.

DLII: when it should check E: it reports: 'Crosslinked
sector [Arrgh]' and ends up in an endless loop warning: 'No more memory
for directory'

STTOOL 1.8: Simply denies any errors. :-(

TuneUp!: Simply crashes when it starts to read the
directory.

The questions are:

What now ? Whats wrong ? What backup system really works ? How can I
get rid of this errors ?

What can go wrong, goes wrong...

Ronald

If your saying I need to buy some ST software, I do. In the last year I've
upgraded Lattice to 5.6, bought NVDI, Blowup030 Hard1, Superbase Pro, Truepaint,
Transartica (Falcon version), Ishar 2 (Falcon Version), registered several bits
of Shareware, bought That's Write 2 and also LDW Power.

[...]
: Dave
I really like your JPEG viewer, it's the fastest i've seen on the Falcon.
But there is one big problem:
* It won't run on VGA! *
Everything works fine until the program attempts to switch to the resolution
the picture is displayed with. After that, the Falcon is in RGB/TV mode, which
means 15Khz horizontal frequency. Most of the newer multiscan VGA monitors
can't synchronize to such low frequencies (mine also). I don't want to plug my
TV to the Falcon, just for watching JPEGs.
I know, 640x480 can't use true color on VGA, but 320x240 can. So it would be
possible to limit the resolution to 320x240 on VGA systems.

Very nice program, though.

bye,
Chris

> > computers.
>
>Ah, and you of course know for a fact that this is not so?

Don't be so facetious... of course I don't know it's a "FACT."

I simply tire of listening to others who claim THEY know for a fact Jag sales WILL mean new Atari computers. Perhaps, but it's not necessarily so.

The computer division continually lost money. The Jaguar game division is making (supposedly) money. Jack Tramiel has said 'Business is war." Where would you put YOUR investment dollars in this scenario?

>Face it, if it weren't for the Jag, Atari Corp. would already be past history
>and there would be NO Atari computers. That's a fact for sure.

I never claimed otherwise nor do I totally disagree with that claim.

ALL I'm saying is that I'm tired of the Jag garnering the limelight while Atari continues to divert their scarce resources from 'computers' to 'game machines.' I've been around long enough that I'm more than a bit nostalgic for the good old days when the Atari computer was recognized as being a superior value. <sigh>

I suggest you try CleanupST, by ICD. I believe ICD has an office in
Germany, and Cleanup is the best disk fixer I have run across. As for
backup software, DiamondBack has a strong following, and I have never
heard of any bizzare errors associated with it. There are numerous
PD/Shareware backup utilities that folks use without problems as well.

One thing I made sure of doing was to boot my system with almost nothing
in the auto folder (and no ACCs) when I would dump or restore any backups.
I did this because I was paranoid about some weird conflict rearing its
head during a critical (i.e. potentially partition-killing) time. Similarly,
I never defrag my disks when it's raining <grin>.

That seems like a fair price for the Falcon but you are getting 'raped' on the Apple stuff. A Mac 660av with 8Mb, 230Mb HD, 25MHz 040 costs ~$1800 in the US now. Wonder why there is such a disparity in pricing in Sweden?

>
>Huh? You mean you _like_ flicker?? :)

No, I dislike flicker almost as much as I dislike smart aleck replies like yours.

The reasoning behing my original comment still stands, however. If you purchase a commercial software product being marketed in your country which claims to be compatible with a television monitor but it turns out it does NOT work right, then you certainly have a complaint. On the other hand, if the shareware product from an overseas developer doesn't meet your demands, just don't pay for it. And if the software is PD... well, you get what you pay for, eh? ;-)

4008. Cubase Audio on PC or Falcon?

Newsgroup: comp.sys.atari.st
Date: 1994-02-28 21:45:47 UTC
From: bouronm@uproar.enet.dec.com
Message-ID: <1994Feb28.164516.1595@peavax.mlo.dec.com>
Source record: 192015

Hi People,

Does anyone have any opinion, or indeed hard facts, regarding the
relative merits of Cubase Audio on a PC vs. that on an Atari Falcon?
Are both versions at the same level? Do they have the same set of
features? And what about extra hardware requirements for a vanilla
486 PC?

Thanks for any and all information.

Cheers,

[M][a][r][c]

I agree with your comments on copy protection. You can also add the fact
that companies go out of business regularly, and you should still be
able to use the software you have paid for.
Since Cubase Score for windows comes with a parallel port dongle, I
guess your SOL.
BTW I never had trouble with disk copy protection schemes ( they could
always be copied) but what happens when your dongle breaks down and the
company no longer exists. This level of software aint cheap enough to
take the chance if its your money.

Trevor.

bull@&*#@*. Atari Australia are in provisional liquidation, and will
probably disappear completely in a couple of months.

The "good" news is that Paragon COmputers in Perth will "supposedly"
take over most the function of Atari Oz. ie by importing stuff such as
ICD products, Gemulator, Sack's 286 emulator for the Falcon, etc....

I definately know this, as I work at an authorised Atari dealer in
Adelaide, and since late 1993 Atari have not taken/delivered anything
and they are on a skeleton staff.

The PC version requires the Yamaha CBXD5 box (about $2000-3000). It is a more professional unit, but is not available yet. When it is, you could use it with an ST, Falcon or TT as well, so there's no reason to get a PC just for that. In terms of software, editing facilities, etc., the programs are identical, although on a TT it will be faster than on a 486/66.

It's about 2000 ukp in the UK and that's from one of the cheapest
suppliers. This does not include keyboard or monitor.

From: warwick@cs.uq.oz.au
Message-ID: <2kubta$10o@uqcspe.cs.uq.oz.au>
Source record: 192029

In the recent demo of Shocker 2, it lists the registration fee (dongle purchase) as *60 DM*, plus *15 DM* for postage.

Is my countries currency falling through the floor, or is Shocker2 really an excellent game (I'm pretty impressed by the initial levels, but it is only monochrome, so I'll toss it aside until I see a colour version (colour 640x400+ that is). They have a TT/Falcon version, but I think that's just compiled for 030 (big deal - it's already fast enough, save 10K disk space).

I must admit that I payed about that amount for Elite2, which isn't really my kind of game (Shocker2 is).

Everyone should check it out, it's very smooth. Not as pretty as OXYD though, on the Falcon. And OXYD costs less than HALF the amount.

I wonder if Meinholf Schneider is bothered by a semi-ripoff of his games asking do much?

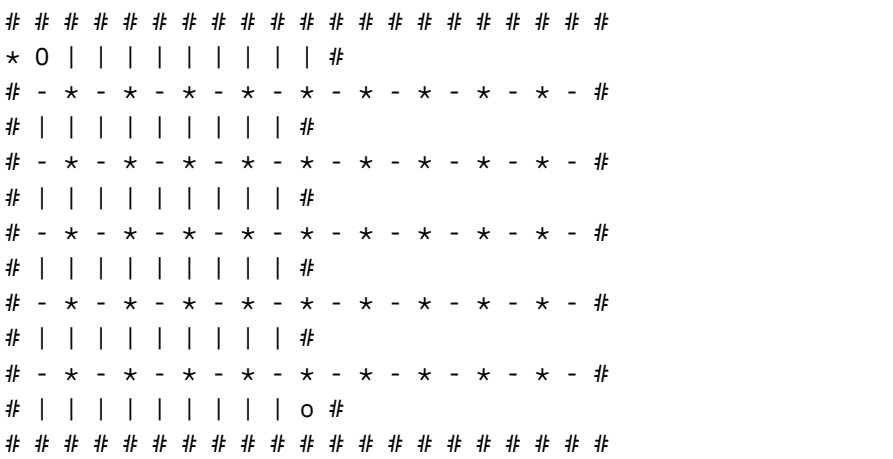
I'm stuck on 2-player level #27. The board just comes up like this:



| and - are closed doors, # is wall, * is walls that look like 4 balls.

It just sits there. All you can do is bash against the walls to no effect.

:-(

(Maybe I'll have to ring the UK phone hotline!)

>and 4 Mbytes is TT RAM. Can any program use both types of RAM at the same
>time?

Sure. When it runs out of TT RAM, it'll start eating ST RAM. Programs
that are FastRAM aware (ie. use Mxalloc() rather than Malloc()) can choose
exactly what they want (eg. demand ST-RAM, request either, preferring TT, etc)

4026. First TT problem - ICD link

Newsgroup: comp.sys.atari.st
Date: 1994-03-01 04:37:23 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <CLyy6C.FEo@watserv2.uwaterloo.ca>
Source record: 192032
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well after setting up my new old TT (TOS 3.01) and switching the internal
48 meg drive with a 105, things seem OK EXCEPT:

The TT refuses to read BIG files from any ASCI device with the ICD LINK
connected. The driver I use is ICD PRO 6.0.2. The hard drive light(s)
(there are two external drives) just blink when trying to read a big file.
This happened when the 105 was external too, but the same files are OK now
its internal. Bizarre!

One obvious (and cheap) solution I suppose could be to use TT SCSI for every-
thing. Which brings me to my question:
Since the SCSI external cable I have which hooks up to the link had a female
centronics connector and the TT SCSI connector has a female(?) DB50 connector
does that mean I can eliminate the LINK with simply a PRINTER cable?
That would be pretty neat!

Other than that, I'm having a blast with the TT - a truly wonderful machine!

You may need the resistors for RAS1, CAS1H, CAS1L... There should be a row of 33 ohm resistors (orange orange black) with maybe two or three spots not filled in.. (If memory serves, they are right along the front edge of the board) Stuff the resistors in, and the RAM ICs, and away you go...

The price is even better if you are a student. My campus sells the 8/230 plus cdrom for $1700. The Falcon can't touch it.

Oh, by the way what is Atari's education price on the Falcon?

I had a Mega2 and up'ed her to 4 before I got my STE. You have
to get a de-solderer and clean all the holes where the rams go
first. This takes a little while (3 to 4hrs. Then you will need
the obvious ram chips, 16 of the beasties to be exact. The resistors for each chip. I also
suggest to place sockets instead of placing the rams
directly on the motherboard as they may not enjoy the heat alot.
The MMU is a real important factor. Some MMU's cannot address
memory over say 2 meg in your case. You will have to get this
checked out, but more than likely it will address 4. It's not
to hard to get another MMU anyway....any ST I believe will do.
Hope this helps a bit.

Hello world,

I've got a MegTT with 8 MB. I compared some programs with and without TT-Ram
access:

ST-RAM TT-RAM

TeX 3min 50s 2min
POVRay 1min 15s 0min 47s
pento 11s 6.7 s (searches for solution in the game pentomino)
mountain 59s 50s (generates fractal mountains)

Also I remeber a comparison of data transfer rates:
ST-Ram: 3.6 Mb/s
Atari-TT Ram: 6.5 MB/s
Mighty Mic: 6.6 Mb/s
MegTT: 7.9 Mb/s

I've been creating a game for the ST lately, and it is now almost ready.
I'll release it at the end of this week. The game is a variant of Spacewars,
crossed with xtank and scorched Earth. You'll be able to build your own ship,
buy different guns, engines, armour and ship bodies. Oh yes, it'll support 2-4
players (3-4 players only with a parallel port adapter).
I hope to upload it onto umich archive this coming weekend.
The game will be called SPACE WAR 2000. (unless someone can v. quickly come up
with a better name - email me)

There are a couple of programs and/or desk accessories that you can use to
reste the printer if you switch on the printer after the computer. Look for
dj_reset dj_on or similar.

> Is there another one? (Currently I am using H&SC or Turbo C 2.0)

GNU C defaults to 32-bit integers on the Atari.

I always use "short" when I want 16-bits, and "long" when I want
32-bits; IMHO, this is a better idea.... it doesn't then depend on the
architecture so much. I think you're guarenteed at least 32-bits in a
"long", no matter what the CPU is.

All bets are off if you're using a DOS compiler of any kind; they seem
to go out of their way to force you to program non-portable code.

Well, what I've heard is that the bass-boost circuit was present originally,
but has been removed from later production runs. So I guess it's a matter of
time; i.e., when did you buy the Falcon...

Source record: 192049
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Ooops, one mistake in my original post about this - I am using ICD PRO 6.2.0 NOT 6.0.2. As well, the problem doesn't occur when GENEVA is running, so it seems that the computer is trying to access too fast with just the regular desktop (or just Neodesk). Anyone else have a similar problem? I can't use TT SCSI exclusively because Spectre doesn't support TT SCSI yet, (maybe when 3.1 comes out!)

Thanks again,
Sam

>> I have heard conflicting info about the audio outs.
>> Is there really a bass boost???
Atari had said that only initial developer machines had the bass boost.
However, Sound On Sound magazine quote Steinberg as saying that all
Falcon users should get the bass boost removed. I haven't played with the
audio on my (new) Falcon yet, so can't say whether or not it has bass
boost.

>> Does the Falcon require some hardware modifications before the
>> outputs can be run into a mixer (a Mackie 1604, for example) ???
>Yes, the inputs and outputs are best attenuated for line level use.
I don't think that this is entirely correct: Yes, the inputs are
mic level, so your line level signals need attenuation (or maybe the
internal mic preamps can be bypassed by suitable modification???), but
the outputs must surely be line-level? (Of course different people have
different definitions of line level, but that's another issue).

4050. NEED help get 1040STe up and running again

Newsgroup: comp.sys.atari.st
Date: 1994-03-01 14:27:22 UTC
From: s169126@compsci1.cc.gettysburg.edu
Message-ID: <2kvjca$roe@jupiter.cc.gettysburg.edu>
Source record: 191907

I need some help finding out some infomation about getting my 1040STe working again. I need a good database program (I think fastbase is good) and to know what has happened with atari Operating systems in the last three years. If someone could give me some general help it would be very helpful. I am trying to get the system running for someone in my family.

Second need to know how to get .zoo and other compression formats to uncompress. I feel like I never used to ST even though I used it for about four years (I had a 520 before).

Any help would be great

Please reply to me

Mike Schuler

4052. High-res mono on a TV

Newsgroup: comp.sys.atari.st
Date: 1994-03-01 15:21:57 UTC
From: mikeg@logica.co.uk
Message-ID: <mikeg-010394152157@dtype.logica.co.uk>
Source record: 191909

I am abut to buy an Atari 1040 for a cheap MIDI setup, and before I splash out on an SM124 monitor to run Cubase and Avalon, is it possible to buy emulators which will allow these programs to work on a normal TV? I have heard about these products, but I imagine there must be some sort of speed/clarity penalty. Any advice would be appreciated.

Don't do it! You really need to get a proper hires monitor. Cubase costs 400GBP? so an extra 70GBP for a 2nd hand monitor or 130GBP for a new one isn't really that much more. You can get mono emulators but as you say, they are very hard to read and slow things down. I'd imagine your MIDI timing would go haywire.

Don,
I agree with everything that you "countered" with in your very complete
reply, except the above statement. If I may paraphrase (as best I can
remember) Michael Slater, author of The Microprocessor Report (who I had
the pleasure (?) of listening to for nearly 5 hours last week), who said:
The "reduced" part of the RISC acronymn is referring to how much processing
is done by each instruction - not to how many instructions are in the
programmer's model. (But what do I know? - I'm a hardware jock!)

> But seriously, why bother with the corrupt past at all? Why not make
> a clean break and the same type of leap as when the 68000 was introduced?
> Why anchor yourself (Moto, I mean) to R6000 (a niche market at best) in the
> first place?

Because, unfortunately, technology is once again driven by "business reasons".

I agree completely with your assesment of the current lack of knowledge
about the realities of the PowerPC chips. As a matter of fact, I *USED* to
read the comp.sys.powerpc USENET group, but there is more misinformation
and emotion found there than facts.

What the hell, let 'em think what they want.... It's probably good for
business (and the price of Moto's stock)!

Well, for one thing, we have 25% V.A.T ... 25%!!! .... (Makes the Falcon really cheap here actually!)

Macs are rare here, you might find them used for DTP or something similar, but not as home-computers ... I guess that's a reason for the high price too.

There is a file called "dealers" on atari.archive.umich.edu (I believe it
is still in /Newitems) that lists several US based Atari dealers. I suggest
you call one of them (Toad Computers would be my suggestion, 1-800-448-TOAD)
and order a copy of Current Notes. CN is a stateside ST magazine in which
you can find ads from mail order firms (among other things).

I think it's a Budgie Licenceware game - sold by PD libraries but some of the money goes to the author. Hence it shouldn't be uploaded to an ftp site.

Sam

>games.

Perhaps because even the original SC1224's color output was far superior to what you could get on most television sets. Perhaps the SC's were less costly than in Europe. Perhaps US users were more entertainment-oriented. Who knows?

The "why" doesn't really matter, though. The fact is that there exist far more color monitor equipped systems in the US than monochrome. Developers simply need to keep the population in mind when targeting their applications. Even though an app may be far superior when run in monochrome, making it mono only restricts the potential customer base... and that's bad enough as it is. ;)

About 3 years ago Atari published the figures in some developer notes about
'relative' sales figures of monochrome-only and color-only ST systems. At
that time it was about 75% color and 25% mono in the US and Europe was almost
exactly the reverse. Of course, things may be different now.

Their address is:

Insignia Solutions, Inc.
526 Clyde Avenue
Mountain View, CA 94043

That's the easy part. Now all you have to do is convince them that the Atari market is strong enough to warrant them bringing this product to life. And it probably won't help any if you mention you heard about it via a comment about a pirated copy of their beta software. :)

> But the Speedo Outline Fonts in .rsc sure are fun. You really need to
>kick the res up to have the speedo system font look nice.

The use of Speedo fonts in "About boxes", dialogs and the like are very useful. For use on the desktop there should be more choices (i.e. the possibility to assign separate fonts for separate parts of the interface.) And, since the rendering aren't as good as PostScript, either have a high resolution on a small screen monitor or stick to bitmapped fonts - those are usually much better since they are optimized.

The worst part is that the AES still use characters for the window gadgets. Try replacing the system font with a 12pt Speedo Courier... :(

>
>It's a big shame that mono monitors aren't more prevalent in the US since
>serious users without them are *really* missing out.

A shame it is, but it's also a FACT. Developers need to keep this in mind
in order to reach the largest potential audience.

>Calamus in medium res would be almost entirely unusable.

Eiuwwww! Calamus in 640x200 medium res? Now there's a hideous thought! :)

Still, I contend that for most modern applications, working with a high
quality color monitor in a usable resolution (640x480 or better) and color
depth (8 bit or better) on a reasonably sized monitor (14" or better) is
potentially more productive than a monochrome only installation. And by
monochrome I mean black and white, not grey scale. Even in a simple app
like word processing, the ability to highlight sections of text in color
is a feature one learns to appreciate if you are 'forced' to use the same
app in monochrome later on.

But let's face it... there is a world of difference between ST medium res
and what I would call 'high quality color.' If your only choice lies with
the SM124 and SC1224 (or equivalents) the SM will be easier on the eyes.

No I wouldn't! And I don't think there's anything wrong with this view
regardless of my (low) opinion of IBM. When a single company has a
stranglehold and a monopoly status like IBM does it makes all the difference.
Because of this - and its abysmal track record - IBM carries enormous
responsibility and deserves much closer scrutiny than a smaller company
would. Simply because the universal effect of a smaller company are not
as potentially cataclismic as IBM's. (As IBM has repeatedly proven... :-)

The problem is that IBM is on its knees right now and has all of a sudden
got very "benevolent". All I'd say is nobody should be taken in by this so:
"Beware of IBMers bearing gifts!" :-)

Well, in order to blow my horn I would have to have a horn to blow...
If you know what I mean... If I said X is garbage but Y is fantastic
I would be indeed blowing my own horn (Y). But I didn't do that.
All I did is pointed out certain things which apparently a lot of
people are not aware of.

> I've yet to see ANY major company where company politics and market-
> ing policy didn't intrude into techical considerations. It's a fact

> moves. Don't view IBM as a monolith wherein all the parts think and
> act identically. The PowerPC team has not been immune to mistakes,
> but I believe they are doing much better than IBM as a whole.

All this is true, however, due to IBM's predominant (*monopoly*)
position it is blatanly unconcerned with users. This is what makes
it particularly dangerous and unpalatable and, therefore, subject
to much closer scrutiny. And I'm affraid IBM is a monolith which is
why it finds itself in such a precarious situation right now. Since
Ackers was let go IBM has been trying to reform but I'm affraid its
addiction to monopolistic mode might be unsurmountable.

But what really infuriates me that IBM has potentially a lot to
offer (in terms of new developments locked up in vaults) but it
doesn't do that. And, quite frankly, if I were is such a predominant
position neither would I. Well... OK, OK, as a non-lawer/non-accountant
(no offence to either) I just couldn't just sit on neat developments
without fidgeting... :-)

> I don't think you and Gregg disagree on the facts, only in how to
> interpret what they mean to the user.

In the immortal words of Inspector Cluseau: "Zet's vat I sed" :-)
Quoting from my response to Gregg now:

We may disagree on interpretation/importance of these facts but they
stand nevertheless and people ought to be aware of them.

>]But seriously, why bother with the corrupt past at all? Why not make
>]a clean break and the same type of leap as when the 68000 was introduced?

>]first place?
>
>Because Moto doesn't believe it will be a niche market. I happen to
>agree with them.

Yeah, and the situation today is quite different. The market was quite
fragmented then so introduciong a brand new processor like that was
feasable. Unfortunatelly, today the stakes are much higher - again because
of dominant position of one manufacturer... (Sigh!)

I have an AdSCSI+ (ICD) hooked to an MegaSTe which do not have
internal SCSI. I it used for my primary hard disk.

Now I have an Apple CD300 SCSI CD-ROM drive.

Can I connect the CDROM to the AdSCSI ? Do I need new or
supplementary drivers for it ?

Thanks.

4080. Compo Software's Address?

Newsgroup: comp.sys.atari.st
Date: 1994-03-01 20:38:56 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <94060.153856STIRRE31@MAINE.MAINE.EDU>
Source record: 191936

I am thinking about buying Compo's Studio Photo for the Falcon.
Apparently they have a demo of the program (disabled save function)
available. Does anyone know Compo's US address and telephone
number? And do they have an e-mail account? Perhaps Compo@Genie?
Finally, has anyone used Studio Photo? I would like to hear people's
comments. Although I don't expect Studio Photo to hold up well
against Adobe's Photoshop for the Mac, I would like to hear comparisons
if available since I have seen and fooled around with Photoshop.
Any help will be greatly appreciated.

>lights come on at once on my SVGA monitor, and it whines major league).

Why not buy Devpac 3.10, which comes with a Falcon compatible version of
MonST (called Mon). It's not as featured as XDEBUG, for instance, but you
get a fully falcon compatible version of Devpac, all the new system
bindings and the new multi-file Hisoft editor. Well worth it, IMHO.

>Alternatively, does anyone know if the STCLUB's Xdebug program works
>on a Falcon ?

I think there is a Falcon screen driver available on my home system, cix.

If you get Codeheads' free (?) Icon Juggler program it'll load neodesk formats and save them as standard NewDesk .rsc files! I used IconJuggler and another PD program, MakeIcon, to get my icons just right!

I reccommend these programs!

Note though that MANY of the files of icons on the net have MANY overlaps! I've downloaded dozens of icon files and found maybe 40 good icons and 400 (maybe 4000) duplicates!

Maybe I should upload MY deskicon.rsc file!

grin

I have a few items for sale:

- 1040 STf TOS 1.02: good condition, drive needs cleaning, as is.
Cdn$200.00

- Atari SM1225 monitor: excellent condition, the Panasonic version;
Cdn$220.00

- Supra 2400 modem w/cables
Cdn$50.00

You pay shipping. Remember: US prices of the above will be about 30%
cheaper because of the exchange rate. Reasonable offers will be
considered. Email me personally if interested.

4102. HD Defragger & FAT Fixer

Newsgroup: comp.sys.atari.st
Date: 1994-03-02 02:44:48 UTC
From: hsp4@namaste.cc.columbia.edu
Message-ID: <2l0uj0$ri4@apakabar.cc.columbia.edu>
Source record: 191858

Since I haven't defragged my HD for about 9 months, I figured it was about time. I dusted off my (not-so) trusty copy of MOS Utilities and ran the defragger, which told me that I had a crosslinked file and couldn't defrag my drive. I went to the FAT Fixer which kept spinning and marking blank spots on my hard disk and deleted files as "unallocated chains" or something, and then locking up.

Obviously, MOS won't do it for me... Therefore, can anyone recommend a PD Defragger (and maybe FAT fixer) which will work on a MSTE Mono 4/40 (Quantum P40S) with BigGEM partitioning and TOS 2.05?

Thanks a lot...

BTW, any recommendations for how to make an STE and Casio CTK1000 keyboard

Was this file ever uploaded to atari.archive?

I checked the atari/Telecomm directory and just could not find
this file...

I was on a mirror, so maybe that's the reason...is the file there????

If so, what's the filename and directory if it's not atari/Telecomm.

Thanks!

It was none other than BlackFunk that wrote on the 22 Feb 94 that ,
B> I was wondering if there are any programs and/or libraries out in net
B> land that offer more (different) icons on the desktop (tos 2.06) than
B> the standard that comes with the ST.

Don't know about usenet archives but certainly on the Fidonet's and BBS's
there are load's of icon's . For editing the RSC file you want to get a hold
of IconJuggler or a general resource editor like ORC's or WERC's

...and don't forget you can load in Nic (Neodesk) icon's into IconJuggler and
use them aswell.

Of course, if it is getting it's RAM via 'Malloc()'. Some programs rely on the assumption that they get all the free RAM as TPA and do no further Malloc()s, but this is not a good programming style.

Has anyone got this program to work!? The DAT files that come with it have no configuration at all in them, so before you can even *read* the errors that appear you have to change the background/text to white....

It runs, gets as far as what should be Spectrum-BASIC, and then hangs.

If I try doing anything GEM-ish, it tells me that 'ROM is corrupt from $0000' which doesn't sound too healthy.....

Will this run on a 1meg machine at all!? (I can't afford more RAM yet, I'm trying to get some case above the negatives so I can get a modem, a hard-drive, RAM, software..... (Decent transport...)).

I can load the Snapshot files (*.SNX) and all they do is present me with their title screens, and promptly hang again.... The instructions are not too great, it says how it works, and how to install things, but not how to actually get it fully up & running!

I've got a 1meg, 1040STE with TOS 1.62 (UK). As soon as I can afford it I'll have a 14.4K modem, 4meg of RAM and a 52meg Hard-drive, but at the moment, I have a very pathetic system!

4109. Spectre Mac emulation: looking for SCSI drivers

I am looking for two Mac SCSI drivers for the following devices.

Insite Floptical drive - I have Floptic404 from IOMega but it does
not recognize my drive.

Toshiba XM-3401B CD-ROM drive - with SCSI interface.

I am running System 6.0.[35] emulating a MacPlus. Are there PD
drivers or comercial ones? Where can I find them? I would also like
to hear from others that have suceeded or attempted to connect such
devices. Please reply by e-mail, if possible, and I will summarize to
the net.

Thanks in advance,

(1:286/2) writes:

s> Than again, you can get a new(!) Quadra 605 4/80 with KB for $900

Lets see, Quadra 605, list price $979.

Add money for keyboard.

Add money for 1 meg VRAM (it only does 256 colors on a 14" monitor with the
512k VRAM it comes with, and you have to throw away the 512k board to upgrade
to 1 meg) When you get 1 meg, you still only get 32k colors on a 14" monitor.
It think that equates to something like 640x480.

Do you have to buy System 7 extra? I think so.

Still need a 0 wait state DSP.

s> On March 14 Apple will intro and sell their PDS Power PC upgrade for
s> $699 that
s> blows away the 040 boards.

Ooooooooh. Guess what? It gives you '2 to 4 times the performance of an '040
when running NATIVE code'. And it gets part of that performance by doubling
the clock freq. I.e the PPC is BARELY faster than an '040 when it is running
at the same clock speed as the '040.

Later,
Gizmo@dswhq.omahug.org

>I know, I was just trying to avoid a futile debate with Roger Sheppard. I
>don't use med-res anyway.

I still do; I've always preferred color monitors, period. Monochrome is so--
well, plain. (Of course, I'm not using PageStream, Cubase, etc.) For use on
a more classic ST with only the 3 32K graphics resolutions, I find UniTerm
to be the most useful all-around terminal program. It doesn't use a GEM
window, so it performs reasonably well on an 8 Mhz 1040 ST, and the VT100
emulation seems fairly complete. The Tektronix vector graphics emulation
leaves a bit to be desired, but those terminals were more like 1024x780 or
even 4096x4096 around 1980 or so. UniTerm's 1K YMODEM works well at 9600 baud,
so I usually transfer PostScript files and view/print offline with the
GhostScript program when I want a higher resolution image. For ST medium res,
I think UniTerm is still the best terminal emulation program available readily
from most ST archive sites. It reminds me a great deal of using an 'xterm',
since it does have mouse-based cut-and-paste and mediocre Tekronix emulation.
All the config menus, etc., are all GEM-based.

Discussions like these have saved me trouble of downloading Connect; the caveat
about poor support for color ST medium res was certainly enough to discourage
me, and I'm grateful. I only wish the archive sites could indicate more
complete system information in program descriptions (color, mono, '030, FPU,
and any other restrictions).

4114. Need help with TeX.

Newsgroup: comp.sys.atari.st
Date: 1994-03-02 07:58:54 UTC
From: dzander@solaria.sol.net
Message-ID: <2l1gvu$1h4@solaria.mil.wi.us>
Source record: 191870

summary: I need help setting up TeX on an AtariST. What are ALL the files
needed for a basic working system? Where do these files go in
a directory structure? What do these files do exactly?

Hello,

This is a plea for help as well as a flame. I'm very frustrated
with the file describtions at atari.archive.umich.edu (a.a.u.e). I
read describtions that say "...help with setting up TeX..." and the
information in the file DOES NOT explain how to set up TeX on the AtariST!
Instead of explaining how to set up a working system these files just
explain how to write a TeX/LaTeX file. They are users tutorials only.
I can NOT find one single file at a.a.u.e. that explains how to set up
a configuration for TeX; including all the files I need and what they are.
So far I figured out that I need these basic elements for a working system:
0) a text editor for creating a .tex file
1) TeX program to read .tex file and convert to .dvi
2) .fmt fonts files (plain.fmt)
3) a printer driver for the .dvi file for hardcopies
What else is needed? These three things just don't work for me. I get
empty pages in my .dvi file. :-(I believe I also need something
called "font metric files" as well as "string pool files".
I would appreciate any help or guidance from someone who has a working
system. Thanks.

Douglas Zander

>etc???

Hi out there,

first you have to put some software speeders for the serial line in your
AUTO folder. I would recommend HSMODAxx.LZH or Turbo-CTS.
be sure your RS-cabel is connected right, all RTS, CTS, DTR and RI are ok.
Set your modem to a fixed speed (like 19200 or more), and also your
BBS soft to fixed speed.
Now: how to get more than 19200? there are some hardware fixes available
to increase the RS speed. There are some cheap fixes to get only 38400,
or a small board called RS-speed or RSVE to get 38400, 57600 or 115k.

If you have more problems send me a mail. I'm also running a BBS based
on atari.

Bye Wolfgang

I believe both of those WILL run with a mono emulator, but believe me,
you DON'T WANT TO!!! For one thing, mono emulators slow down the
computer and, with MIDI applications, could cause timing problems,
plus I think both of these (or Cubase at least) is pretty flakey on a
mono emulator (the screen doesn't update properly).

Although Atari has redesigned the Falcon030's audio output circuit to
remove the bass boost circuitry, the design change hasn't been
implemented at the factory yet (kinda like Atari redesigned the TT030
to meet FCC Class B computing device standards, but never put the new
design into production).

4123. Falcon030 & Digital Audio

Newsgroup: comp.sys.atari.st
Date: 1994-03-02 10:55:20 UTC
From: steve-j@teleport.com
Message-ID: <2l1rao$f6b@kelly.teleport.com>
Source record: 191879

Okay, here's a text file I got that some of you Falcon030 owners may
be interested in:

Guys... do the following mods at your own risk. Remember the Falcon is
loaded with surface mounted VLSI (and custom VLSI) so observe all static
precautions!

To remove the bass boost from the Falcon's audio output:

Change C58 and C59 from 100pf to 1000pf
Change R123 and R130 from 10K to 15K
Change R59 and R68 from 100K to 4.7K
Change C95 and C90 from 0.33microFarad to 1K resistor

To reduce the built in speaker amplifier gain:

Add a 10K resistor between pin 2 of U21 (at R119) and AGND (at R111)

To reduce the gain of the Falcon's Audio Input by 6dB:

Remove R56, R57, R90, R92, C21, and C81
Change R66 and R87 from 100K to 47K
Add a 470pF NPO +/- 5% capacitor in parallel with R67
Add a 470pF NPO +/- 5% capacitor in parallel with R88
Add a 100pF NPO +/- 5% capacitor in parallel with R66
Add a 100pF NPO +/- 5% capacitor in parallel with R87

I believe that's the Steinberg-recommended way to 'fix' the Falcon030's
audio circuitry.

Sorry Folks

A friend of mine told me the following:

GSZRZ 4.1 ist not Shareware. You have to pay for it.
I just don't know if older versions of GSZRZ are just Shareware but I try to
find out if you're interested in.
If there're shareware versions I could upload this to a german FTP-Server.
For nearer details please contact me under
Patrick_Koehne@un.maus.ruhr.de

I could alternative post the e-mail-address of the author then you can
ask him yourself.

The story said that Atari Germany bought too much property (compared
to their business plan), and how reducing the number of offices would
help offset this liability.

I don't know, I always thought buying property was a smart move.

>Ofir ogal@cix.compulink.co.uk

If Steinberg's current offerings on the PC are anything to go by then you
would be better off with the Falcon version. Cubase for the PC needs a fast
processor just to stay in time and there are too many bugs for it to be
considered for serious work. It looks pretty though :-) There are other, much
more reliable programs for the PC.

Cubase on the Atari is supposed to be much more reliable with more features
included.

How much is it if you are *NOT* a student (not everyone in this
world can afford the $$$ to throw at school, just to get a computer
discount)?

>Oh, by the way what is Atari's education price on the Falcon?

Oh, if you aren't aware, I don't believe Atari has *ever*
had an education price (kinda hard to do for a smaller niche market).

So, to make sure we're not comparing "apples and oranges" (pun intended)
what is the Mac price WITHOUT student discount (i.e. real world)...

>"It does more, costs less and it's that simple'

Good thing it's simple - I'd never be able to figure it out
otherwise... :-)

: Graeme

There is a program called F_S_DUMP which saves a raw picture format.
Yet another proggy called XIMGSAVE converts this raw format to XIMG. Both
programs can be found on:
ftp.tu-clausthal.de:/pub/atari/falcon/systools/ximgdump.zip

hope this helps,
Chris

4137. Falcon JPEG Viewer

Newsgroup: comp.sys.atari.st
Date: 1994-03-02 14:00:24 UTC
From: oldcornd@cs.man.ac.uk
Message-ID: <1994Mar2.140024@cs.man.ac.uk>
Source record: 191894

OK Over the last week I've been making some major changes to the viewer, especially to the DSP code, so I might as well update as to what is going on.

In the public domain, version 2.18a is available from Umich and all its mirrors (src.doc.ic.ac.uk is very fast for UK users) - this is the 030 version, and is more or less the same as the current version (2.20), except that 2.20 supports interlaced GIF's, has some mouse-controlled routines in (I'm working on extending these) and has a few small changes to the interface.

The latest DSP version is a substantial improvement, 2.20 now has a large number of rewrites and optimisations to improve DSP performance so it now reaches its quoted 5x faster speed all the time rather than just on certain pics (the 030 version takes about 17.5s to do a test 640x480 2x2 1x1 1x1 Q75 JPEG, whilst the same pic took 3.8s on the DSP version).

I've also had a lot of enquiries and questions comparing it with the Brainstorm viewer, which it used to be (generally) a little slower than on most pictures. It now should outperform Brainstorm on any complex image (i.e. no large areas of blank space, and high Q factor) because I do the Huffman on the DSP so I can chuck the DSP's approx. 20 mips at it instead of the 030's approx. 3.5 (so as the Huffman works harder, mine relatively improves). For Q75 2x2 1x1 1x1 pics, mine and Brainstorm run at almost exactly the same speed. For greyscale mine is usually about twice as fast, whilst for 2x1 1x1 1x1 pics I usually lose out by a factor of about 10-30%. But the Brainstorm one is Public Domain I think, whilst my DSP code isn't, because writing 280k of assembler source gets to you and you need a few beers to cope with it (grin).

The viewer also supports JPEG compression (to a limited extent), and GIF, Targa, Degas and SPC512 picture formats on the viewer (Jpegs display fastest of all of them on the DSP version!). It can handle as big a pic as your memory can, and if you have silly size JPEGs (like the 344K, 1700x1700 ones I have) it can cut them down so you can actually view them. The viewer also has slideshow mode and lots of useful features, now handles more files at once (up to 320 I think), and JPEG's can be contrast expanded if required.

Anyway, end of shameless plug. If anyone has any comments about it, get in touch!
Dave

Good man, James; go for the throat. ;-)

Ofir has to be kinda tentative, he can't afford to upset Steinberg too much.

As the CBX-D5 is a killer box in itself, or will be whenever it's actually
finished, a massive PC might not be necessary, since it's offloading lots of
the processing. I predict the CBX-D5 sitting there faithfully replaying your
tracks, with WinDog nearby saying "general protection fault at 4:BD32". :-(

4140. *** ANNOUNCEMENT : MEMDEBUG ***

Newsgroup: comp.sys.atari.st
Date: 1994-03-02 14:33:03 UTC
From: rEnE Schmit <rene.schmit@crpht.lu>
Message-ID: <2l282v$a3q@caladan.restena.lu>
Source record: 191897

```
Hi everybody

Memory management errors are notoriously hard to find.
That's why I have decided to make MEMDEBUG publicly available.

Feel free to contact me if you have any questions

rEnE

Here is the README file:
-----------------------------------------------------------------

MEMDEBUG version 1.5

Author: Rene Schmit
Email : rene.schmit@crpht.lu

*************************************************************************

Copyright (C) 1992-1994
Centre de Recherche Public Henri Tudor
6, rue Coudenhove-Kalergi
L1359 Luxembourg-Kirchberg

This software may be copied, distributed, ported and modified in source or
object format as long as :

1) No distribution for commercial purposes is made.
2) No third-party copyrights (such as runtime licenses) are involved
3) This copyright notice is not removed or changed.

No responsibility is assumed for any damages that may result
from any defect in this software.

*************************************************************************

Package Description:

FEATURES:
---------
MEMDEBUG is a free utility for C programmers that provides,
among others, the following features:

* Memory management error detection:
Memory leaks
free()'s of unallocated memory blocks
...
```

```
* Memory usage error detection
Accesses to previously free()'ed memory
Off-by-one errors in memory blocks
...

* Memory usage profiling
All kind of memory usage statistics
Trace of memory function calls
...

* Error simulation
Low memory simulation
...

USAGE:
------
Using MEMDEBUG is very simple:

Compile the package once.

Add the following line to each of your sources:
#include "memdebug.h"

Recompile and link your program.

MEMDEBUG is activated by defining the MEMDEBUG
pre-processor symbol at compilation time

PLATFORMS:
----------
MEMDEBUG is written in ANSI C and should be completely portable.
It has been tested on the following platforms: ((?) == as far as I know)

MACINTOSH MPW C
GNU C
Think/Symantec C

PC Borland C
Microsoft C 7

HP Workstations (both 680x0 and RISC stations)
HP C
GNU C

DEC VAXC (feature subset, as VAXC not an ANSI
compiler)
GNU C (?)

SUN Sparc GNU C

Indigo GNU C

Atari TT GNU C

DISTRIBUTION:
-------------
```

The distribution kit contains all necessary sources and
documentation (PostScript file). NO object files are provided.

There is a simple test program. BEWARE: this program might crash
on your machine, as it does some really nasty stuff. Use it primarily
to check which features are supported on your machine! (comment out
source until it doesn't crash any longer).

A sample makefile for UNIX users is included (provided by
Wilfred Mollenvanger and John Borst)

memalpha.c
memalpha.h
memdebug.c
memdebug.h
memfree.c
memfree.h
memtypes.i
test.c
README
Quickstarter_Guide.txt
Memdebug.ps
makefile

MEMDEBUG is free! It is available by ftp on the following server:

```
+-----------------------------------------------+
| ftp.crpht.lu in directory /pub/sources/memdebug |
+-----------------------------------------------+
```

This server is brand new, so there might still be some
problems, and the directory structure might change in the near
future.

People in the US might also try:

ftp.netcom.com in directory /pub/gurgle/memdebug

Feel free to make MEMDEBUG available on other ftp sites!

Support:

There exist two mailing lists related to MEMDEBUG. For more
information, send an email to

majordomo@ftp.crpht.lu

with the following body

help
info memdebug
info memdebug-announce
end

You may also contact me by email if you
* have any problems
* detect any bugs
* have suggestions for improvements
* ported MEMDEBUG to a platform or compiler not mentionned above

And above all, email me if you

* like :-) (or dislike :-( ) MEMDEBUG

4142. RE New Files

Newsgroup: comp.sys.atari.st
Date: 1994-03-02 15:16:53 UTC
From: ce830@cleveland.Freenet.Edu
Message-ID: <2l2al5$89u@usenet.INS.CWRU.Edu>
Source record: 191899

Second try.
I have uploaded some new files to umich with help from Mickey Boyd.
The first is pmj_eng2.zip
Premium Mah Jongg II is one of the first games, which supports all
important ST-/TT-/FALCON- and color graphic card resolutions.
- FALCON-SVGA_16 800 * 608 in 16 colors
- FALCON_SVGA_256 800 * 608 in 256 colors
- CrazyDots/Matrix 800 * 600 in 16 colors
- CrazyDots/Matrix 800 * 600 in 256 colors
- CrazyDots/Matrix 1024 * 768 in 256 colors
- Matrix 110ZV 1280 * 960 in 256 colors
- Matrix 1280 * 1024 in 256 colors
- ST Low 320 * 200 in 16 colors
- ST High 640 * 400 in monochrome
- TT VGA 640 * 480 in 16 colors
- TT High 1280 * 960 in monochrome
It is a HD utility that does tuneup and repair.
It supports BMG partitions with sectors to 8K in size.
I have used it on a ST with Tos 2.06 & My Falcon.

>
>While the Power PC indeed has a lot of power, it is marketed by Apple,

Uh, excuse me... the Power Macintosh line is marketed by Apple. IBM markets (and manufactures) the PPC 601 chip. Motroloa will produce the PPC 603 chips. Bottom line is Apple markets computers, not chips, OK?

>REAL computer users (i.e. Unix/real OS users) do not like Apple, because
>like it or not Apple computers are for stupid people !!
^^

Oh, brother... do you have any idea how embarassing it is for the rest of us knowing that some people who read this will attribute such idiotic statements to _all_ Atarians? This is really childish stuff, gang.

> ... real users find the apple GUI gets in the way of what they want
>to achieve.

Hmmm... since the Mac makes heavy use of a GUI, may we suppose that you consider all Atari users are stupid too? Oh, and we better add Windows users, and Amiga users, right? Ah, and even though it's UNIX, I run 'OpenWindows' on my SparcStation and only resort to the command line when I must... so that's stupid too, eh? And let's don't forget the SGI machine next door. Yep, it's UNIX but with a sweet GUI. Too bad that anyone that uses it will have to be considered 'stupid' now, eh?

What about DOS? Since you have to type in commands the 'real' way, I guess that makes all DOS users smart, right?

>(Sorry to make such generalistions but its true).

Perhaps true only within the confines of your sheltered little mind.

Sorry folks, but it always irks me to see such quantum leaps of stupidity being posted in a public forum. And rampant stereotyping, whether directed towards people _or_ machines, is the trademark defense mechanism of those people who lead such insecure lives that they must attack anything and everything that doesn't fit _their_ mold of 'correctness' in order to feel good about themselves. It's really rather sad when you think about it.

Someday, Mr. Griffiths, you will find the courage to sneak out from behind your mum's apron and discover there really is a whole new world out there, full of wonderful and diverse ideas, just waiting to be discovered, enjoyed and appreciated.

Sounds to me like your Mac-loving friends either a) don't know what they are
talking about or b) have a severe case of AV-envy (either is very likely!) :)

I own a Mac 660av (and a Falcon030 so don't yell) and I can assure you that it
is not only fast, it is extremely stable, as well. Some very old games don't
like its DSP audio and some AV machines didn't like 800K floppies at first.

Regardless of what anyone says, however, _neither_ platform enjoys the benefit
of a wide assortment of DSP-specific commercial software.

I only wish the Falcon had an 040, even an LC040 (without math coprocessor)!
That would _definitely_ change the nature of the beast. :))) <BIG grin>

```
Blitzschnell Hard Drive Defragmenter and Optimizer
Version 1.46 Beta Release
Programmed by Erin Matthew Monaco
May 29, 1992

**************************************************************************

Written in 100% assembly language Blitzschnell is compact and offers the speed
not found in high level languages. This program is SHAREware. If you like it
I ask that you send a check or money order for $20 + $3 s/h to;

Mr. Erin Monaco
35244 Chestnut
Wayne, MI 48184

The assembly language source code for this program may be purchased for
$99 in U.S. funds by writing the above address.

Since this is a Beta release I would appreciate all comments or suggestions.
Please feel free to write or call me at (313)-485-2818. My address on GEnie
is E.MONACO.

WHAT BLITZSCHNELL ISN'T

This program is not a data recovery system. While it can be used in a very
limited way to rid your drive of some problems, it is not intended or
recommended that you use Bliztschnell on seriously messed up drives, as
there is a good chance you will just mess things up more. This program is
designed to defragment files and folders, clean up directories, and help
keep your File Allocation Tables in good shape. This program can alert
you to a number of problems and will try to work things out. It is designed
to keep good drives in GREAT shape, if your drives are really scrambled I
suggest you try to use one of the data recovery systems available on the
market to save what you can. Most often serious problems are only cleared
up by reformating or erasing your partition(s). (I am not suggesting you
do this, the choice it utimately yours, but this program is only intended
to keep your drives in order so they may run at their best data throughput
rates). As of version 1.47 AUTOVER.TOS a freeware program from Beckemeyer
Software will be included with the Blitzschnell package. Before using this
program you should run AUTOVER.TOS, it will check your drives for any
problems. IMPORTANT: If AUTOVER.TOS reports any problem no matter how
simple you should NOT use blitzschnell to defragment that drive/partition
until all the problems have been corrected as Blitzschnell will not work
properly if your data is corrupt in any way.

OPTIMIZING DIRECTORIES:
```

Will optimize your directories. Specifically what this option does is complete remove deleted entries from your directories, this can save space and time, if for example you had 300 fonts in a folder and deleted all but 8 of them, the system would still use 19 clusters, where you only need one!

CONSOLIDATING CLUSTERS:

This option groups all clusters that contain data together, so all empty clusters appear towards the bottom of the drive. This is also done when you choose to defragment your drive automatically. It can be a powerful tool for those who wish to defragment their drives manually as well.

AUTOMATIC DEFRAGMENTATION:

This function is completely automatic. After choosing it an alert will pop up asking you if you want to defragment the currently selected drive. Select "OK" and watch it fly!!!

Here are the results from my defragmentation timings:

Computer Partition Amount # Files & Blitzschnell's Hard Disk Sentry
Memory Size (Megs) Used Folders Time min:sec Time min:sec
==========
4 Megs 10.0 3.7 146 00:57 02:57
4 Megs 10.0 7.3 364 01:53 06:02
4 Megs 10.0 7.6 327 02:23 B.F N.T
4 Megs 10.0 10.0 417 02:29 01:46 *
4 Megs 32.0 30.5 1298 08:12 33:10

---
1 Meg 8.3 8.3 391 02:18 N.T
1 Meg 32.0 30.5 1298 11:26 N.T

---
512 K 8.3 8.3 391 02:39 N.T
512 K 32.0 30.5 1298 OOM N.T

OOM = Out Of Memory (not enough to do it), N.T = Not Tested.
BF = Badly Fragmented.

* It only took H.D. Sentry 1:46 to KILL not only the partition it was working on but also the NEXT partition as well.

OK, I've finally gotten up and running!

A while back I promised to start a serief of what I consider to be the best German shareware translated into english. Well, the first was uploaded to a.a.u.e last night!

It is HD_FREE. It's a CPX for Atari'x Xcontrol which shows a nice bargraph of available disk space and memory. Simple but nice and I use it all the time!

I'm currently working on three more utilities: Upoint, HSMODA02, and the Wincolor CPX (which is finished). These will be uploaded whenever they're done...

I'm calling the project BOAST for Best Of Atari ST. I've included the originall and new versions in each package. Look for a complete, native English translation of the docs to HSMODA02 in another week!

Well, that's that!

.s.
(give HD_FREE a try... It's grrrreat!)

I had a quick go with Studio Photo on a recent fair. The trouble with Studio Photo is that operations are on the entire picture and cannot be masked (we didn't find any masking capabilities). It is really aimed at home users that want to play with Photo CD stuff. Retouche and DA's picture are much much more like Adobes Photoshop, but I am not familiar enough with any of these to give a well-founded opinion on this subject.

Erlend.

From: erkamp@titan.arc.ab.ca
Message-ID: <CM1rt3.Hnw@arc.ab.ca>
Source record: 191814

Well I've been playing this game sorta but I appear to be doing something wrong when it comes to the copy protection. It asks for "Page N, Line N of Word N" which in itself is pretty bad english. Anyways I type in the appropriate letter including heading lines (not the chapter header though) and everytime I dock I am getting asked for this until eventually I get booted out of the game because I supposedly have not been entering the right code. So what am I doing wrong? Is it really supposed to be "Page N, Word N of Line N"? Also if I ever do get it right does the game always ask you for a code when you dock?

Da's Picture is an incredible product for Photo Retoushe and Adobe Photoshop
Type applications. Retousche Pro CD, which incidentally is now known as
Da's Layout & Repro CD concentrates a lot more on final product output (i.e.
hardcopy as well) as supposed to Da's Picture whichhas some incredible
masking, brush and water tools.

A small press info was released on the Lexicor List not too long ago, speaking
of related programs however, the only other program that could match up on the
atari sektor of Da's Picture is Chagall. I use both, and like both. However
I have not received an update for a while, and am using it less and less.

Da's Picture is modular and is compatible with the other line of DA Products
and module tools, so eg. Da's Layout, Da Vector Pro, Glook, Screeneye
modulets etc. and a soon-to-be released photo cd driver.

DA products are distributed in Germany by H3 and DA, in the U.K. by CGS
and in the USA by Lexicor. If you like any more info, feel free to email
me or the others *grin* at support@lexicor.com.

Cheers

Yat @ Lexicor

4160. Want to trade SCSI drive for Megafile

Newsgroup: comp.sys.atari.st
Date: 1994-03-02 18:19:59 UTC
From: rhett@bigwpi.WPI.EDU
Message-ID: <2l2lcf$83@bigboote.WPI.EDU>
Source record: 191817

I have a 25 meg SCSI drive. It is a La Cie drive and came out of a
MacSE.
What I would like to do is trade it (with mounting case) for a DMA
hard drive for my 1040STf.
I am interested in getting a Megafile 20 or 25, nothing smaller than
20
(in fact, I dont even know if they exist, and for that matter, I am
guessing
on the name Megafile, so what I mean by that is one of those older
Atari
Hard Drives made for the ST that were DMA and about 20 megs!)
I am going home for spring break and might check my mail when I am
home.
Please reply to this account. Thanks in advance.

Well at least some one else is as out of date on ICDs Pro software as I am :)

But seriously were you using AHDI to boot the internal SCSI drive, and
ICD to handle the external drive? Basically did the system hang when you
were trying to copy the files to the drive on the SCSI bus?

A test would be to try and read one of those "big" files into a text editor
and write it out. If the system does not hang in this case but does hang when
copying the file then trash either the AHDI software or the ICD Pro software.

AHDI/HDX makes a rather rash assumption that it will be the only ACSI/SCSI
driver software. When this happened to me with ICD sw controlling an ADSCSI+
on the ACSI and AHDI controlling the HD on the SCSI I tossed AHDI and have
been happy ever since. I later moved all my drives to the TT SCSI port and
purchased ICDs Pro software.

Brian

>If that is the case, how is Atari able to advertise the Jaguar?

Atari advertises the Jag the same way Commodore (at least in Europe)
advertises CD32: A small portion of the price of each machine is
allocated for advertising. Thus, if you allocate $6 from each machine for
advertising, and you sell 100,000 machines, you have $600,000 to spend on
ads. Naturally, you would want to pre-allocate some money for this
purpose.

When the modem's buffer fills up, the ST steps all over it. It seems there is no flow control btw the two.

Also, the modem doesn't want to hang up when told to. It just echoes back to the remote terminal.

From: galaxis@traveller.freiburg.sub.org
Message-ID: <2d74f7c41122234@traveller.freiburg.sub.org>
Source record: 191822

Hi...

I was recently asked whether there is a possibility to but more serial ports
on a TT (MIDI Port has already been rebuilt to standard serial)...

Does anyone know of VME cards with serial ports or something like that,
which can be used in a TT (only idea I had on that...)?

thanks,

/\|ex.

:>>While the Power PC indeed has a lot of power, it is marketed by Apple,
:>Uh, excuse me... the Power Macintosh line is marketed by Apple. IBM
:>markets (and manufactures) the PPC 601 chip. Motroloa will produce the
:>PPC 603 chips. Bottom line is Apple markets computers, not chips, OK?

Well the 'POWER PC' is the common name for the 'Power Apple' as you put it,
lets not be pedantic, and lets not argue about whether I know about the
PPC series.

:>>REAL computer users (i.e. Unix/real OS users) do not like Apple, because
:>>like it or not Apple computers are for stupid people !!
:> ^^
:>
:>Oh, brother... do you have any idea how embarassing it is for the rest
:>of us knowing that some people who read this will attribute such idiotic
:>statements to _all_ Atarians? This is really childish stuff, gang.

No... I was merely making a joke out of the way apple computers try
to hide the real 'insides' of the computer from the end-user. IMO for
programmers and people using the computer for other things than
word processing this data hiding can get in the way. Yes there will
be a time when OOSE type interfaces and high level abstract user
interfaces will viable, but Apple computers are just plain annoying ->
ever heard of redirection and stdin, stdout?

:>> ... real users find the apple GUI gets in the way of what they want
:>>to achieve.
:>Hmmm... since the Mac makes heavy use of a GUI, may we suppose that you
:>consider all Atari users are stupid too? Oh, and we better add Windows
:>users, and Amiga users, right? Ah, and even though it's UNIX, I run
:>'OpenWindows' on my SparcStation and only resort to the command line
:>when I must... so that's stupid too, eh? And let's don't forget the
:>SGI machine next door. Yep, it's UNIX but with a sweet GUI. Too bad
:>that anyone that uses it will have to be considered 'stupid' now, eh?

Well when I use X-windows, the windows tend to contain command shells :-).
Gui's are very useful but from my own experience the Apple one gets in
the way of what I want to acheive, I mean like dragging a disk to the
trash can to eject it is really obvious ,right? not!

:>What about DOS? Since you have to type in commands the 'real' way, I
:>guess that makes all DOS users smart, right?
:>>(Sorry to make such generalistions but its true).
:>Perhaps true only within the confines of your sheltered little mind.

Well I made a sweeping generalisation as a joke about apple computers,
know if you intend to insult me personally then you are going to lose
bigtime.

:>Sorry folks, but it always irks me to see such quantum leaps of stupidity
:>being posted in a public forum.

I think someone down personally is more of a quantum leap of stupidity and
shows greater insecurity on your part. Stop being so bl**dy serious.

:>And rampant stereotyping, whether directed
:>towards people _or_ machines, is the trademark defense mechanism of those
:>people who lead such insecure lives that they must attack anything and
:>everything that doesn't fit _their_ mold of 'correctness' in order to feel
:>good about themselves. It's really rather sad when you think about it.

I am far more accepting than you, your outburst is totally uncalled for,
you talk about 'correctness' yet by posting you are contradicting yourself
because I don't fit your view of 'correctness' it doesn't mean you should
slag me down. Perhaps I was too 'unsubtle' for you, your dig at DOS users
could be interpreted in the same way. How can you call a Falcon owner
'insecure', its people who buy PCs who buy for security, I own all
Falcon,ste,amiga and a PC(:-)), I like all these machines, but I don't
like MACs, they are the most inefficient machines in terms of use of power.
(hope you can see the irony in the Power PC).

:>Someday, Mr. Griffiths, you will find the courage to sneak out from behind
:>your mum's apron and discover there really is a whole new world out there,
:>full of wonderful and diverse ideas, just waiting to be discovered, enjoyed
:>and appreciated.

What have you contributed to the Atari world then Mr Hutchinson?
Far less than me, thats for *certain*

I'm full of far more diverse and wonderful ideas, I push the machines
I program to their limits, to me programming is an Art, its something
I have a talent for, apart from standing on your high horse and
slapping peoples wrists you have nothing to say.

Over the last four years I have received over 1500 letters congratulating
me on my Atari work from about 30 different countries.

Its attitudes like yours that make me want to give up on the Atari scene,
you simply cannot take a joke, but then again perhaps it was too unsubtle
for you (laughs at the American sense of subtley and irony).

>Hutch- @ Fair Dinkum Tech

(you can stand down of your podium now).

4170. Gnu C help needed

Newsgroup: comp.sys.atari.st
Date: 1994-03-02 20:42:28 UTC
From: norway@ionews.io.org
Message-ID: <2l2tnk$bum@ionews.io.org>
Source record: 191827

Can anyone help me with properly setting up the gnu C compiler on my
4 meg Falcon? I'm using gulam as my shell and have set up the environment
variables as follows:

```
set env_style mw
setenv PATH '.,\gnu\bin,e:\bash\utility'
setenv GNUEXEC 'e:\gnu\bin\gcc-'
setenv GNULIB 'e:\gnu\lib'
setenv GNUINC 'e:\gnu\include\gcc'
setenv GXXINC 'e:\gnu\include\g++'
setenv TMP 'g:'
setenv TEMP 'g:'
setenv TMPDIR 'g:'
rehash
```

When I try to compile a simple hello.c code this is what I see:

```
e:\gnu\bin >> gcc -v hello.c -o hello.ttp -lgcc

gcc-atariST version 2.5.7 Patchlevel 1
cpp -lang-c -v -undef -D__GNUC__=2 -D__GNUC_MINOR__=5 -Datarist -Dgem
-D__atarist__ -D__gem__ -D__mc68000__ -D__atarist -D__gem -D__mc68000
-Acpu(m68k) -Amachine(m68k) hello.c g:/cc100000.i

cmd exit code 1
```

All the binary, include and library files are in their proper folders, and
if I type:

```
gcc-cpp -lang-c -v -undef -D__mc68000 -D__GNUC__=2 hello.c g:/cc100000.i
```

I get:

```
GNU cpp-atariST version 2.5.7 Patchlevel 1
#include "..." search starts here:
#include <...> search starts here:
e:\gnu\include\gcc
e:\gnu\lib
\gnu\lib
End of search list.
```

The file cc100000.i is generated, so I can only conclude that gcc
is not able to run the gcc-cpp program, even though the GNUEXEC environment
variable is correctly set up.

Any help would be appreciated.

David Snowdon (norway@io.org)

Hello everybodyouthere!

In an older message I found this:

--------------------cut here---------------------------------

According to my experience in compiling MacMiNT, you'll need:
*^^^*

from ~ftp/atari/Mint/Gcc of atari.archive.umich.edu,
bgas138p4.zoo
mgutil36.zoo
bmake363.zoo
mgcc253b.zoo

from ~ftp/atari/Mint/Lib,
mntinc39.zoo
mntolb39.zoo

(Because I'm not using atari, it may not be true...)

hoshi

----------------------cut again---------------------------------

What does that mean. Is it a Mint version for Macintosh or am I just going
crazy ;-)

I'd really appreciate if someone could fill me in on this matter!!! And please
do not
bother telling me this is a FAQ ;-)

Thanx in advance :-)

Someone please tell me how IBM has a "monopoly" on the computer market.

They don't own the two predominating operating systems (MS-DOS and Windows).
They are the _#5_ seller of personal computer systems (behind Compaq,
Dell, Apple, AST and Toshiba) as of last month.
Their marketing channels are demonstratably poor.
Their prices are (in general) demonstratably higher than their competitors.

Yet they have a MONOPOLY? Please, Atari users, do me a favor: I own an
Atari (four, in fact, though I only really "use" two) as well, so please
stop embarrasing me, as a part of the Atari community, by vainly trying to
"prove" that the Atari is superior and/or the PC is inferior. Atari as a
company is an embarrasment to the American market and their "customer
service" is an insult to their users. I could state literally dozens of
examples, but I won't. Personally, I'm of the opinion that Atari's
computer division will be nonexistant by the year 2000 so I've taken my
steps to get off this sinking ship - but it's still an embarrasment to
hear aboutople talk about things they don't know about.

> out on?

Not much, really. Lessee if I can summarize:

- wind_set (?) calls to change the colour of window parts (like the
frame, sizers, etc)
- a 'smaller' item beside the 'fuller' for iconizing windows; this is
only present in an unreleased beta version of MultiTOS (AES
4.something)
- a call to see where a window icon should be drawn on screen when
iconizing a window under MultiTOS
- a WM_TOPPED message under MultiTOS for when your window becomes the
top window due to other windows closing

Hmm, is there anything else? There's some support for colour icons, but
I don't know if that needs a different call, or just an appropriate
resource file.

No, I was saying that _Atari_ killed the Atari market, not piracy.

Then again, we all went over this a few months ago, the first time some
bozo asked about Cubase cracks... For more fun of this type, read
rec.games.hack (the NetHack newsgroup)... at least once a month some
idiot asks for cracks of something. Over there, though, they play along
as if they were asking for NetHack spoilers... ;-)

My Falcon occasional bombs during a rez change with 2-10 bombs.
Much more common though, is for it to just hang for a minute or so and then change resolutions...
Or, it will hang and stop, and I can type keys and hear them but the screen is white....
Then , after I fiddle for awhile, it either does a final lock up in which I must cut the power to reboot, occasionally displaying garbage on the screen if I'm lucky.

But, most common is an annoying 30-50 second wait where nothing appears to be going on.
I don't think I've ever beat the 30 second mark for a rez change.
(And my hard drive is not vbeing accessed during the pause)

I have tried this with no auto folders. (In fact, I reformatted my drive once to try to fix this... it didn;t help)

Currently, I have the standard maccel auto. That's it unless I enable multitos, etc.

No one at Atari or my dealer has the slightest clue why this occurs, and neither, I'm afraid, do I.

You lot have been asking for a Archon clone, it looks like someone has created one! It's quite large, and the info' file says:/

0.5 Meg Minimum
1 Meg Recommended
2 Meg Best

It is also apparently STE enhanced a very little bit.

I found it at ftp.uni-kl.de in the pub/atari/Incoming/ directory, filenames towdat1.zip towpowpt1.lzh towpowpt2.lzh (Something like that).

I'll stick up a quick message once I've finished downloading it!

I think you will need at least a 486/33. Don't forget that 'offloading'
means shoving stuff down the scsi port at very fast rates. This requires
processor time.

Ofir ogal@cix.compulink.co.uk

Just my 2 cents: A 44MB SyQuest can be bought from Mac shops (SCSI only) for as low as $289, perhaps even lower (I got this figure when leafing through MacUser last night.) An ICD Link doesn't cost $210 (Isnt't that one just over a hundred bucks?).

Figure out a suitable offer youselves, but I wouldn't pay more than $250 for it.

Jon (who got a 88c instead - works great!)

4208. FAQ: GDOS drivers 1.8, parts 3-5

Newsgroup: comp.sys.atari.st
Date: 1994-03-03 08:57:11 UTC
From: CASTAN@cip.physik.uni-stuttgart.de
Message-ID: <2l48p7$pqr@info2.rus.uni-stuttgart.de>
Source record: 191765

6 Errors

Errors in the printer drivers - that I know - are the following:

1 These drivers display fonts with the attribute 'light'
2 Doesn't work on TT
3 The EXTENDED ENQUIRE FUNCTION (VDI 102, vq_extnd) doesn't give back the parameters as listed in the german 'Profibuch' (Jankowski, Rabich, Reschke - Sybex)
4 Using the attributes 'italic' and 'outlined' the letters of bitmap fonts are cut off on the right side. This error appears independent from other attributes being used.
This error was in the Libraries of the driver-sources from Atari and seems to be included in all drivers except to NVDI and SpeedoGDOS.

If theres nothing written about an error I don't know if this error appears or not.

Seems it's no accident, that Xact only uses the attributes 'fat', 'italic' and 'underlined'. (See [14])

Another reason against using 'outlined' is the following:
If you make a driver calculate an outlined font from a normal one it get's 'wider' by two pixels. Due to the reason that a pixel has a width depending to the resolution (other than a fitted font) a text gets different widthes in each resolution. But who wants to have different textformat on different printers? The only way to stop this is letterspacing - typographic 'bullshit'.

7 Fonts

7.1 General

There are many fonts on the Internet only for the screen and maybe useable for one printer. Everybody using these fonts should know that he can't print documents in an acceptable quality via GDOS.

But in the Atari- and former BELA-package there are contained the fonts for all printer drivers in this package (the 360*360dpi fonts are missing in the Atari package). If you have a useable program you can print every document with every driver.

Speedo removes this problem.

7.2 Bitmap-fonts

The fonts used are bitmap fonts in the DR standard format. (See [1] and appendix)

7.3 Vector-fonts

The vector fonts with the old FSM-GDOS format are named with OTL.

These fonts and drivers should'nt be used no more and are listed to only for completion of this FAQ.

The vector fonts in SpeedoGDOS format are named with SPD.

8 Printer

Producer	Printer	Drivers Fitting
NEC	P6+,P7+, NECP... P60,P70	NB15 (FX:,:NX1000)
HP	LaserJet_II	HP_LJET
HP	DeskJet, LaserJet_III,IV	DESKJET (HP_LJET)
CANON	BJ10E	BJ10
CANON	LBP_4/8	CANONLBP, LBP
Mannesmann-Tally	MT_90	MT90

Drivers in brackets work but don't use the ability of the printer totally. This means - for 24pin-printers - that these are used in 9pin mode. At HP-compatible Laser- and Ink-printers this means that the data isn't packed though being supported by the printers.

Some Deskjet drivers are told to make problems. In this case try the Laser-jet driver. The printing takes longer then (due to more data) but the problems should be removed then.

The meaning of compatible normally is made by the producers of the compatible printers.

Notes:

o If you don't find your printer in the list and knows a fitting driver, please inform me.
o Try other drivers even if you have found one fitting to your printer.
o Of course the FontGDOS-drivers have strong problems with the memory. But the speed of them is faster than the other (Speedo not considered).

8.1 List of availability

In the German TOS-Magazin July '92 page 24 contains a list.
If you know about list available europe-/worldwide inform me.

9 Programs

Nowadays it's obvious (but not usual) to use GDOS in every program.

The following list is limited to those using GDOS to print too.

Kind of program	Program	Distributor	Speedo

This list is no commercial. I'll include every program I get to know.
(Comment by the Translator: Sorry for mentioning Atari Works three times,
but I wanted to keep the 'Text/DTP' and 'Spreadsheet' Chapters')

Notes:

o Programs listed in the Speedo column with yes* support Speedo but don't
use it - don't output text too.
o Xact can print without Speedo too.
o FSM-GDOS is included in the Wordflair II-package.
o Platon only outputs Metafiles via GDOS.
o I didn't make it to print via GDOS in OPUS.
o Programs only printing via Device 21 are out!

Kandinsky Version 1.57 and TreeView are available together in:
ftp.e-technik.tu-muenchen.de pub/comp/platforms/atari/incoming

10 Utiliies

10.1 fontfix

Problem: The font height is included incorrectly in some fonts. fontfix
discovers this error and corrects it.

On the Internet fontfix can be found here:

ftp.uni-muenster.de /pub/atari/Applications/Dtp/Fonts/Gdos

ftp.cs.tu-berlin.de /pub/atari/utils

10.2 Outline Fonts

Outline Fonts Accessory by CJG Copyright (c) 1992-1993 Atari Corporation

This utility edits the EXTEND.SYS for SpeedoGDOS. This file contains a
description of the volume from the Speedo-Caches, the fonts and the
font sizes. The Caches can be saved to disc an be loaded again, too.
A well done program, except that the offered cache sized are fitted to
FSF-GDOS, not Speedo

Filename: OUTLINE.PRG alias OUTLINE.ACC, 67644 Bytes

Included with SpeedoGDOS.

Why doesn't Atari make programs that include a display of the version?

10.3 Printer driver

GDOS Devices Accessory by CJGCopyright (c) 1992 - 1993 Atari Corporation

To edit the ASSIGN.SYS

Filename: DRIVERS.PRG alias DRIVERS.ACC, 64878 Bytes

Before starting this program it's better to create a backup of the
ASSIGN.SYS!
The two reasons are the following:

1. The informations about the Bitmapfonts are removed without comment.
2. ASSIGN.SYS is replaced by a new one if 'Benutzereigen'-'Hinzuf�gen' (in
the German release) is selected wihtout any chance to get it back.
(The English Version should have a Dialog like 'Own drivers' 'Add' or
similar). To all coders: Don't copy that style!

If this utility should sometimes display no drivers, simply start
ASSIGN.PRG (see 10.4 ASSIGN)

DRIVERS.PRG/ACC only displays the speedo drivers of my collection. Does
anybody know, how it does this? It doesn't even display the filename but a
name being included as string in the driver. How does one get it?

10.4 ASSIGN

ASSIGN 1.0a is by Dirk Sabiwalsky (PD).

It tests three things:

o Are there several fonts using the same ID and have different Names
(typefaces)?
o Are there several fonts using the same ID and the same pixel height?
o Are there several fonts with the same name (typeface) and different
IDs?

10.5 FONTCHK

FONTCHK tests GDOS fonts if they have possible errors.

It's included with ProList, for example.

10.6 FONTCNV

Converts GDOS-fonts from Motorola to Intel format.

Comes with ProList too.

10.7 GEMFont

Font editor able to read Signum and PK (TeX) Fonts too.

Internet: ftp.tu-clausthal.de:pub/atari/systools/gdos/gemfo120.lzh
Use the chance to get a new unlzh or lhxarc.

10.8 FontMonger

Converter and editor for different vector formats including Speedo. Only works on IBMs or MAC though.

11 Distribution

11.1 Atari

The drivers with the name Atari are available from Atari. Send three disks, Money for shipping and a friendly letter to them and you'll get them with printer drivers and fonts.

This Package is available at Atari-shops too.

No docs but for this price ...
(That's the way in Germany - other countrys may differ!)

11.2 BELA

The fonts with the name BELA were available from BELA

There were two discs with packed Printer-drivers and fonts for them

The fonts DO have the same IDs as ones from Atari, but the internal font NAME is different. Due to this these fonts are not correctly accepted by some programs if used with Atari fonts.

There's almost no documentation. Not even a hint about who owns the copyright for the drivers or about the author(s)

One last thing about BELA: R.I.P. ;-)

11.3 FontGDOS

The drivers from this package are really much faster than the former ones. (Only bitmap fonts and graphics are comparable of course)

I didn't have any problem using these with other GDOS ersions but you must limit use to the old Fonts.

FontGDOS is the successor to Atari GDOS. Mainly, it differs in the Bezier functions, and had faster (and colorable) drivers. It has no relation to FSMGDOS or SpeedoGDOS.

FontGDOS is available from several firms which use it for their programs.

11.4 Language

The driver named Language is spread on the language disc for the MegSTe

11.5 Internet

The drivers signed with "I" can be found on the Internet.
For example: ftp.cs.tu-berlin.de

11.6 Working Title

The WT drivers are spread with Calligrapher. They are (c) Working Title, the wt-driver are licensed by Working Title.

No drivers are on the Calligrapher DEMO-disc. The drivers coming with Calligrapher-lite (15DM) are signed with CL in the tables.

Screenfonts are on both discs.

11.7 Speedo-drivers

SpeedoGDOS is available for everyone now (in Germany 99.-DM)

Contents:

o Installation program
o Speedo font engine
o 2 Programs to edit ASSIGN.SYS and EXTEND.SYS
o 14 Fonts in Speedo-format by Bitstream
The Falcon-Speedo (in Germany) comes with 18Fonts now
o 14 Printer drivers
o An Installation-Manual

Outrageous features are:

o Speed
o Not the whole Font-file has to be read (Memory-saving)
o 16bit-Fonts (no 256 Character-limit)

See [4]

The information if it's a Speedo- or Bitmap-font can be found in byte 33 of the Fontname (vqt_name, INQUIRE FACE NAME AND INDEX, VDI 130). Zero means bitmap font and one means FSM or Speedo font.
this means the information to this in [14] is wrong.

Some Problems are inportant to be mentioned:

A coder can't find out if a driver can handle Speedo fonts (see last question in 10.3)

Some font-IDs are used by Bitmap- AND Speedo-fonts, though different fonts with similar IDs may never be installed the same time.

If you don't take care of this you'll get bombs.

Speedo depends on the user to install the right drivers and fonts. The coder cannot do anything to stop errors.

The best way is only to install Bitmap-fonts with the right drivers or to use a Speedo-only system.

The Monospace-font coming with Speedo has no 'umlaute'

Don't Trust [14] about saying that SpeedoGDOS is not updated.

For Installation and coding best is to refer to [5-7]
Remember to start NVDI before SpeedoGDOS in the AUTO-Folder!

The ones that bought Speedo got 4.0, the Falcon-buyers got 4.1

Now Version 4.2 (beta) is available with remarkable bugfixes. Speedo 4.2 is (in Germany) available as bundle or update (40.-DM) from R.O.M. Only COMPO is selling it single.

Speedo 4.2 get's the Font-ID by adding 5000 to the internal one. NOW the problems with same IDs in bitmap- and vector-fonts are history.

11.8 COMPO

Compo offers a package of 40 Fontcuts in Bitstream Speedo-format (99.-DM, price may change): 4 Cuts of Bitstream Amerigo, 1 of Blippo, 1 Broadway, 1 Brush Script, 1 Caslon Openface, 1 Dom, 2 Kaufmann, 2 Ribbon, 14 of Swiss (Helvetica), 14 of Zurich (Univers)

11.9 IMG-0300

On the Internet:

ftp.uni-muenster.de /pub/atari/Gdos

11.10 Others

I am not choosing drivers to list here. I'll list them all! The authors and users of the programs should email me information about drivers they would like to see in the list. Please include code length, date, and known bugs.

11.11 FTP

Many students can get software worldwide via ftp (comment by s.d.: lucky boy'n girls ...). Prices for steady connections are constant, but connections between America and Europe have to be paid depending to the volume of data transferred.

Please try not to ftp over the Atlantic and use short ways.
Do your tranfers during off hours of the server (not 9am - 5pm).

Files with known names can be found by Archie.

In Germany:
login: archie
help

In the US e.g.:
archie.ans.net

The Archie-databases ask about once each month one ftp-server after the other for freely available files

12 Source

Being a developer it's possible to get an almost complete printer-driver in object-code. This one should only be fitted to a special printer.

This package is available for GDOS and SpeedoGDOS.

13 Tips'n tricks

13.1 Pixeltrash at printing, advice for users

Printing graphics on a NEC P6+ (maybe other printers too) including a lot of black in a line I often had the problem that one line was left out (Speedo-drivers NB15, NECP) or two lines were printed displaced in one line (Speedo-drivers FX80, NX1000).

This happens when printing directly and via CENSPEED. When using VARSPOOL this effect no longer occurs.

VARSPOOL can be found on the driver-disk of the NEC-printers.

13.2 NEC P6+

Once in a while a NEC P6+ will get noisy (rrrrrrrrrrraattatatattaa).
When you open the front you'll see a round stick (about 1cm thick).
Put two drops of sewing-machine-oil on it each year (you'll get it from Mom)

14 Tips'n tricks for coders

Fontsize and Pixelsize

Here are my experiences with GDOS and WYSIWYG. Credits to Ulrich Rossgoderer for confirming these.

It's about the output of vector graphics and text on screen and printer.

The size of text is defined in point and is always the same - independent from the resolution of the output device.
Different are vector graphics: they have to be recalculated in pixels before the output. This Should be no problem because when opening a virtual/physical workstation you get the pixel size in micrometers in devParm[3] and devParm[4].

Let's assume the vector graphic is saved internally in micrometers, then the definition points at the output simply have to be divided by devParm[3] or devParm[4] to get the position in pixels. When doing the output in windows an offset has to be added. But thats not relevant here.

So far for the theory being quite simple (see [3]).
Now for the practice.

As described above we output a text and a border - saved internally as vector graphic. It doesn't matter here if the text is a Speedo or a bitmap font.
To have a better chance to compare the border exactly surrounds the text.

Doing this I got the following experineces: The text exactly filling the border on the screen (ST-high) is - when printed - much too small compared to the border.

An error in the recalculation of the pixelsize can't be the problem, because I made the printing with the drivers NB15, NECP, FX80, NX1000 and the results are the same.

I have only one explanation for this: The screen driver supposes a different resolution for the pixelsize than for the font size.

Two solutions I can offer:

First you can use another pixelsize on the screen than the one given from the operating system. After opening the virtual workstation (and ONLY this one!) I claculated
devParm[3] := 282
devParm[4] := 282
and with this parameter I made the recalculation from micrometers in pixels. Now the relation from graphic to text on screen and print-out is exactly the same. But now a DIN A4-page doesn't fit on the screen in it's width.
The numbers are found by me the experimental way and possibly can be optimized

Another solution may be this: Use a smaller font size for the screen (and ONLY there!) by multiplicating the size with 72/96. This is simple with Speedo-fonts because the size in points can be defined by almost endless values behind the point. Using bitmap fonts this won't work due to not having a font in a 72/96 times size for every printer font. (Different to translate this, sorry - SD)

This method surely is to be modified for ST-Mid and other resolutions.

From Wilfried Behne (Half NVDI ...): SpeedoGDOS ignores the devParm[3] and [4] - values of the screen drivers. The values of physical workstations ARE taken.

15 Addresses

(Lot's of stuff is available from the friendly Atari-dealer 'around the corner ;-/)

(Note: All addresses are German ones - excepts when marked!)

16 Miscellaneous

16.1 Critics

16.1.1 Critics to the author

Critics are greatly welcomed. To get more info, send email to:

G.CASTAN@physik.uni-stuttgart.de

Possibly one writing me has already tested two or three drivers.
Please write me if the errors listed above occured or not.

Anybody knwoing different driver support addresses, please write me an email.

16.1.2 Critics to the translator

Hi, this is Stefan writing :-)
The reason why I wrote this translation I can't find in my head ...
Guess it's because Atarians should work together and support each other!
Well, if you wonder about some errors of spelling or syntax remind this:
I learnt English at school for 4 years an after that I kept my knowledge
actual by playing some textadventures and now by reading
comp.sys.atari.st and comp.sys.atari.st.tech :-)
If you find some errors in this translation, please don't send them to Gerd but
to me:

stefan_damerau@sl.maus.de

But take care of the gateway-rules:
No mails bigger than 16kB and please no big UUE-stuff :-)

Thank you and have fun and lot's of experience with this FAQ.

Bye
Stefan

16.2 Praise

If this FAQ helped you out of a problem, please write me a postcard in your
next holidays.

16.3 For my support

Due to actual experiences I ask the distributors to switch on verify when
copying Update disks.

I only know two distributors not making any problem with this. But one of them
doesn't send no updates anymore - though of having to do this due to contract
with the developer and though he fixed several bugs following my recommen-
dations.

Could One of the readers try to write a Speedo-Fonteditor? We (Gerd & Stefan)
offer our time to beta test it ;-)
[I remember that this sentence was slightly different before Stefan
translated it - Gerd]

16.4 Trademarks

This document is full of trademarks, no to be used free|y.

16.5 Guarantee

I'll offer no guarantee.

17 Appendix

17.1 Literature

[1] Douglas N. Wheeler, EVERYTHING YOU EVER WANTED TO
KNOW ABOUT GDOS (AND MORE), (Internet, Filename:
GDOS.ARC oder GDOS.TXT)
Here's written all what's important to know about GDOS drivers.
(AND MORE)

[2] Jankowski, Rabich, Reschke, Atari Profibuch Professionals book],10.
Auflage,
SYBEX, D�sseldorf (1992)
The Standard. For Coders: In the VDI-Part you'll find how to use
screen and printer drivers correctly.

[3] Marc Rene Gardeya, VDI f�r jedermann [VDI for everyone], ST-Computer 10/93
Introduction in correct programming of screen and printer outputs.

[4] Julian Reschke, Herbstgedanken, ST-Magazin 11/92
Autumn-thoughts about SpeedoGDOS and Font-GDOS.

[5] Erik Dick, Sch�n und schnell? [Pretty and Fast?] , ST-Computer 7/93
Common info about GDOS and installation of Speedo. Almost the same
standing in the installation-manual, but more information about special
problems

[6] Erik Dick, SPEEDO-Gonzales, ST-Computer 8/93
Important stuff about programming Speedo. Description of the new
bindings tips for coders for standard uses.

[7] Erik Dick, SPEEDO-Gonzales, ST-Computer 9/93
Meaning of the Speedo Error messages and bindings of the Bezier and
cache routines

[8] Raymond Schr�der, Atari-Hotline, ST-Magazin 7/92
Whats GDOS for? Which programs supports it? How to install it?

[9] Sven Behne, Wilfried Behne, NVDI-Dokumentation, BELA
VDI description. But no description of the differences between screen
and printer drivers.

[10] Wilfried Behne, Andreas Kromke, Traps in the Atari ST's VDI
and how to get around them, c't 1991, Nr. 3
Much about errors in the screen drivers.

[11] Laurenz Pr�ssner, : es ist alles so sch�n Bunt hier [Oh, take a look at
these colors], ST-Magazines 5/92, 7/92, 9/92
How to handle more than 256 colors with device depending formats

[12] Laurenz Pr�ssner, Sekt oder Selters [Champaign or mineral water],
ST-Magazin 4/93
MEMORY.SYS: Binding, way to handle color resolutions, font output
with and without SpeedoGDOS.

[14] Laurenz Pr�ssner, Summertime Blues, Sd-Magazin 6/93
Listing to open the MEMORY-driver. In this article there'd be now way
for a coder to find a difference between vector- and bitmap fonts.
That's wrong.

[15] Oliver Scheel, Erste Hilfe f�r [1st aid for] MultiTOS, ST-Magazin 6/93
Common information to install MultiTOS.

[16] G�nter Born, Referenzhandbuch Dateiformate [Reference Dataformats],
2. Edation, Addison-Wes�ey, Bonn (1992)

With the right drivers it's quite simple to make output in .IMG and
in .GEM format In this book is a description how to read these formats
again (and more).

[17] G&#65533;ntgr Born, Dateiformate [Dataformats] Programmierhandbuch [Coders
manual], Addison/Wesley, Bonn (1993)
Sources (TurboC, TurboPascal) for loading and saving the formats
to use the datas [16] is recommended.

[18] Tim Oren, Professional GEM, (Internet, Filename: PROGEM)
Tim Oren almost only describes the programming of the AES but without
him this list would not be complete.

> I would appreciate any help or guidance from someone who has a working
> system. Thanks.

I thought there was a neato install-program with the CS-TEX setup on
a.a.u.e. If that's not so, contact me by e-mail. I'll be glad to
help you. In the meantime, you should check if you also got all the
fonts. The `font metric files' are just tables of the dimensions of
all the characters, used by TeX to typeset the text. To do the actual
printing, the dvi-driver needs the `real' fonts. Got those? They
use, by the way, a minimum of about 5M on your harddisk.

Good luck, and don't hesitate to contact me.

HP Laserjet printers are well supproted by SpeedoGDOS : I use speedo
with SCRIPT 3.5 (from Application System) and with a QMS printer
emulating a HP printer; it works great and I have no problems.

: What does that mean. Is it a Mint version for Macintosh or am I just going
: crazy ;-)

No, you're completely sane. It's MiNT for the Mac (called MacMiNT), and it
even runs native Atari code (at least some of it). Sense: to make programs
with command line interface available on Macs.

Unfortunately it needs >= 8 MB RAM to run decently.

Available from various ftp archives throughout the world.

anisko (anisko@usdtsg.DaytonOH.NCR.COM) wrote:
: Can someone explain to me the concept of a "PGP Key" i.e. how does
: it work?

There are two parts to the key
1) Public Key - sent out to everyone that you want to be able to PGPMail you
2) Secret Key - accessible ONLY by you, and needs a passphrase to operate
it.

Someone writes a message to you in a text editor. They save the file, run
PGP with parameters like -east <textfile> <yourname> and this 'signs' and
encrypts the message so that only <yourname> can read it. They must have a
PublicKey for <yourname> in order for this to work :-) A PGPfile is created
(normally filename.pgp) and this will be included in an Email to <yourname>

The message can ONLY be decrypted using the SecretKey and PassPhrase of
<yourname> and that is what you would do when you received the PGP file. You
would just save the Email message into a file naming it something like
message.asc and copy that file to your PGP disk, or decrypt in Situ if
that's the way you work :-)
The command would simply be PGP <PGPfile> . This would recreate the original
texfile and , if you have the public key of the person who mailed it to you,
check that the message really IS from him/her and that it has not been
tampered with.

You must NEVER let anyone have a copy of your SecretKey, and if you suspect
it has been compromised, change it immediately!
The PGP docs are excellent and explain all this in much more detail, but
hopefully this shows how it actually works?

Ste\/e..

I got this archive the other day, and I've had exactly the same problems,
on a Falcon 4/127 Tos 4.04. The only game I have got to work is
Jetset Willy, and even that has strange masks around some of the sprites
(with Attributes turned on), or just grey sprites (with Attributes
turned off).

Earlier versions work ok, but can't load snapshots!

From: ma2jswc@midge.bath.ac.uk
Message-ID: <CM37H9.Cr6@midge.bath.ac.uk>
Source record: 191775

I've now uploaded Tower Power onto atari.archive.umich.edu and ftp.uni-kl.de
It's in 2 parts, towpowpt1.zip and towpowpt2.zip. The game is a slightly souped
up version of Archon with 2 to 4 players.
It'll run on a 0.5 meg ST, but 1 meg or more is strongly recommended, 2 meg+
being ideal. Sorry, but I don't think it'll run on a falcon, Mega STE or TT, (though I
haven't actually tried running it on any of them).
Oh yes, the data disk is also on there, towdata1.zip
I still have the source for the game, so any bugs can be fixed. - please do
bear in mind that the games is almost 2 years old now.

I know this level and had the same problem. I called the German Hotline
and they told me this is a bug in some older versions. They gave me
the code of the next level. If you play OXYD from a write protected
floppy your codes should be the same. If you ever played level 10 on a
non write protected floppy, the following codes won't help you. Try to
unpack the original archive instead.

Link-levels Code
26 48291479
27 57046486
28 98396160

Hy there,

I bought my Falcon in october '93 and there's no bass boost in it.
If you want to get line signals into the mic port you have to put a
resistor into the cable. I don't remeber the size but try to get
the ST-Computer 11/92. You will find it there (or perhaps somebody
else can post it ?).
The headphone outputs are on line level. I got no problems connectins
them to a mixer or a preamplifier.

Ever heard of DMA? I'm pretty sure the PC uses DMA for hard-drives (it does
for sound-cards), you have to remember that even with DMA there is a lot
of interrupts happening (after each sector read) and these need
servicing - When my Falcon is writing to Hard-disk using ICD pro the
slowdown is about 40-50%, The PC would suffer less with this problem because
of its faster CPU.

Have you set the UNIXMODE environment variable? The mintlib and
the gnulib add some features to the standard TOS file system,
such as allowing forward slashes in place of backslashes and
providing a default drive prefix for absolute pathnames. These
features are configured (turned on in most cases) with the
UNIXMODE variable which may hold a string of letters, each of
which has some meaning. Settings of UNIXMODE that generally
prevent most problems are '/rU' or just '/'. '/' turns on
conversion between back- and forward slashes, and 'rU' lets
absolute paths originate in U: (MiNT unified file system). For a
complete documentation of UNIXMODE, see the file UNIXMODE.doc
that comes with the sources of mintlib and gnulib.

Currently, the Jag goes for $249.95, this includes an RF connector, ac adapter, the Jag itself, Cybermorph, lot of instructions and pamplets, as well as advertisement for the Lynx. Oh, I forgot, it comes with a card board box that everything fits in :-) It supports the standard S-Video signal though you have to buy/build a cable to connect s-video to the television (this is the same for composite and RGB). This cable goes for about $19.95 (which I don't think is yet available).

Latest word on the CD-Rom is summertime (june-august).

4234. Re: Falcon JPEG Viewer

Newsgroup: comp.sys.atari.st
Date: 1994-03-03 15:07:50 UTC
From: raphael@brasil.frmug.fr.net
Message-ID: <2l4ug7$4a@brasil.fr.mugnet.org>
Source record: 191791

David Oldcorn (oldcornd@cs.man.ac.uk) wrote:

: OK Over the last week I've been making some major changes to the viewer, especially
: to the DSP code, so I might as well update as to what is going on.
:
: [stuff deleted]
:
: The latest DSP version is a substantial improvement, 2.20 now has a large number
: of rewrites and optimisations to improve DSP performance so it now reaches its
: quoted 5x faster speed all the time rather than just on certain pics (the 030
: version takes about 17.5s to do a test 640x480 2x2 1x1 1x1 Q75 JPEG, whilst the
: same pic took 3.8s on the DSP version).
:
: I've also had a lot of enquiries and questions comparing it with the Brainstorm
: viewer, which it used to be (generally) a little slower than on most pictures.
: It now should outperform Brainstorm on any complex image (i.e. no large areas of
: blank space, and high Q factor) because I do the Huffman on the DSP so I can
: chuck the DSP's approx. 20 mips at it instead of the 030's approx. 3.5 (so
: as the Huffman works harder, mine relatively improves). For Q75 2x2 1x1 1x1 pics,
: mine and Brainstorm run at almost exactly the same speed. For greyscale mine is
: usually about twice as fast, whilst for 2x1 1x1 1x1 pics I usually lose out by a
: factor of about 10-30%. But the Brainstorm one is Public Domain I think, whilst
: my DSP code isn't, because writing 280k of assembler source gets to you and you
: need a few beers to cope with it (grin).
:
: Anyway, end of shameless plug. If anyone has any comments about it, get in touch!
: Dave

Hello.
It seems that you have currently a BIG 'brain-storm' problem:-)
After reading your last messages, I can suppose (am I right???) that you
have been using all last programming hours in 'looking' and 'devining' a
lot at my DSP decoder routines..
It seems that if there are bugs in it, I can ask you to fix it, since you
seems to know my code better than myself...

Just hope that your 'new' DCT code doesn't begin with:

```
move X:(r0),x0 Y:(r7),y0
mpy x0,y0,a X:(r1),x1 Y:(r7)+,y1
macr x1,y1,a r2,r6
mpy x0,y1,a a,X:(r0)
macr -x1,y0,a X:(r4),x0 Y:(r3)+,y0
mpy x0,y0,b X:(r5),x1 Y:(r3)+,y1
macr x1,y1,b a,X:(r1)
```

```
mpy x0,y1,a b,X:(r4)
macr -x1,y0,a X:(r3)+,x0 Y:(r4),y0
mpy x0,y0,b X:(r7)+,x1 Y:(r1),y1
...
...
```
or something like this, with all register names swapped...

Hep, just a funny trick: You want to decode images about 30% faster with the actual Brainstorm DSP decoder??? Very easy, in fact: Just write a fast replacement of the DSP XBIOS routines, and install it as a TSR. Since my DSP decoder is system compliant, it really speedup decoding by 30%!!!

Raphael Lemoine (Brainstorm)

raphael@brasil.frmug.fr.net

To D. Oldcorn: If you have 'PERSONAL' messages (like the one which begins with 'brainstorm:', don't you think it whould be better to send it to me by mail???

In March, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well, we will give attendees a copy of our own newsletter "The Hard Copy".

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, March 9, 1994
DCS Course Room, Room 2009 (2nd floor)

Call 725-2068 for more information.

Hope to see you there,
Dani Roloson

Atari TT030 for sale.

-Has 2 megs ram.
-has 50 meg HDD
-1.44 floppy

Price $2,000.00 or best offer

-VGA Color Monitor
-Can connect to TT

Price $350.00 or best Offer

-Monitor And TT together.

Price $2,200.00 or best offer.

I am posting this as a favor for a friend. He told me
he doesn't have the Boxes, but does have the manuel and disks
that came with the TT. Alternative Boxes will be provided by him.

If you are interested, please mail me.

AES 4.1 is currently only available as a beta-test version for registered developers.
One is not supposed to talk about AES 4.1 at all... You should have seen the
envelope it came in - RED, and completely impossible to see through. And it
was marked:"Do not open this envelope if you don't know how to keep your mouth shut"
(Or maybe some other words that expressed the same meaning...)

|> computer, but quite adequate for a game console.

Jeez.

The 68000 is mostly used to distribute tasks for the other processors.
Like kicking them off...
It will of course not be used for the time-critical parts...
In fact, as I understand it, it isn't necessary to use the 68000 at all, it
sits in there because certain higher-level (not time-critical) functions are
more easily written in 68k assembly than some obscure risc assembly.
I just fail to see how this can possibly slow down the Jag...

In article 8783@gos.ukc.ac.uk, mdg@ukc.ac.uk (M.D.Griffiths) writes:
>
>Well the 'POWER PC' is the common name for the 'Power Apple' as you put it,

Common or not, it's still incorrect. 'Power PC' is the name for the chip series. Many manufacturers other than Apple will be using them (e.g., IBM).

>:>>REAL computer users (i.e. Unix/real OS users) do not like Apple, because
>:>>like it or not Apple computers are for stupid people !!
>:> ^^
>
>No... I was merely making a joke out of the way apple computers try
>to hide the real 'insides' of the computer from the end-user.
>IMO for programmers and people using the computer for other things than
>word processing this data hiding can get in the way.

So now we understand your inflammatory comment was only a 'joke' and the rest was strictly 'IMO,' was it? Wish you would have said that initially.

>Gui's are very useful but from my own experience the Apple one gets in
>the way of what I want to acheive. ^^^^^^^^^^^^

Your 'experience' does not make it global for the rest of the world.

>Well I made a sweeping generalisation as a joke about apple computers,
>know if you intend to insult me personally then you are going to lose
>bigtime.

I am not concerned about 'losing' to you or anyone else. This is not a contest nor is my intent to insult you personally. I am only attacking the 'sweeping generalisations' you made which _I_ found to be insulting, childish, and extremely unprofessional. And that's IMHO, BTW!

>Stop being so bl**dy serious.

Perhaps. If you tell us when you are 'joking' next time it might help.

>I am far more accepting than you, your outburst is totally uncalled for,

I disagree. I think your outlandish comments demanded a reply.

>... your dig at DOS users could be interpreted in the same way.

What dig? None was intended. Heck, I still use DOS, too, when I must.

>How can you call a Falcon owner 'insecure',

How was I supposed to know you own a Falcon? Your post didn't mention it.

>I own all Falcon,ste,amiga and a PC(:-)), I like all these machines, but
>I don't like MACs, they are the most inefficient machines in terms of use
>of power.

Hey, good for you. I own 2 ST's, a Falcon, a Mac and I just sold a 486-66DX2. I much prefer the Mac over the PC but that's just _me_, OK? Your mileage may differ and it doesn't bother me a bit if your preferences are different. Personally, I have always thought poorly of Amiga machines but I would never stoop to calling someone STUPID just for using one. What's the good of that?

>What have you contributed to the Atari world then Mr Hutchinson?
>Far less than me, thats for *certain* ...

Ah, another one of your *certain* facts, I suppose. I salute you, then. ;-)

>Over the last four years I have received over 1500 letters congratulating
>me on my Atari work from about 30 different countries.

We are all very happy for you, I'm sure. :) Again, this is not a contest, Griff. I do not feel the need to list my accomplishments and contributions to the Atari community like some kind of 'resume.' Those that know me know what I have done and that's reward enough for me.

>Its attitudes like yours that make me want to give up on the Atari scene,

Ah yes... the ubiquitous threat to abandon ship. I've heard it before, Griff. Why do people feel the need for this crutch? An even better question... why should I or anyone else care what you do? It's your choice. Go for it.

>you simply cannot take a joke,

Sure I can, when it is identified as such. You failed to do so. Try a :)

> (laughs at the American sense of subtley and irony).

And you close with a final stab at my country of origin? Pathetic.

OK... last try to make you understand. It matters not which brand of system you prefer. That's your choice. What upset me was your callous comment that 'Apple computers are for stupid people,' ostensibly because of its GUI. With that comment, I logically inferred you meant the same thing about Atari users (who generally work without benefit of a command line interface or UNIX OS like 'REAL' computers use, to use your terminology). I didn't like that. No one likes being called _stupid_, even in an indirect manner. OK?

The two things which always set me off are 'piracy' and 'stereotyping' as others here will attest to by experience. :) You simply hit one of my ON buttons, is all. Dissenting opinion is one thing... flames are another.

Enough waste of bandwidth... let's continue this in email, if you insist.

My apologies once again <sigh> to the readers of c.s.a.s.

But if we could jeust get a Speedo editor it would be great. There has been many a time when I've wanted to change the icon inside a window gadget. This could be our chance.

I do like using the speedo fonts in the alert boxes. In fact all the programs I've written in the last six months has these resources built in and when run on a system with that capability uses them instead of the generic boxes.

Dan

Yes I have heard of DMA :-)

All I know is that PC users report that standard Cubase for Windows is
unusable on a 386. Maybe it's Windows, I don't know. I do know that Cubase
is pretty fast on an 8MHz ST+NVDI.
And yes the Falcon could do with a faster processor.
I don't think Cubase Audio on a PC is a good idea, a Falcon or a Quadra +
some sound card are a better solution.

No flames, here... just some clarification, OK?

I'm sure our buddy Sinclair was referring to the resellers who are pushing
Q605's for about $850 w/keyboard. I know some outfit in CA was doing this.

>Add money for 1 meg VRAM (it only does 256 colors on a 14" monitor with the
>512k VRAM it comes with, and you have to throw away the 512k board to upgrade
>to 1 meg)

No, the standard 512K VRAM is on the motherboard, not as a SIMM. The extra
512K VRAM (2-256K SIMMs) is only about $30 and user installable, anyway.

>When you get 1 meg, you still only get 32k colors on a 14" monitor.
> It think that equates to something like 640x480.

Yep, 'only' 32K colors on up to 16" monitors, 256 up to 21". Resolution is
more dependent on the monitor itself, not the amount of VRAM, however.

>Do you have to buy System 7 extra? I think so.

Naw, System 7.1 comes with it. Has to as that's all that will run on it. :)

>It <the PPC upgrade board> gives you '2 to 4 times the performance of an '040
>when running NATIVE code'. And it gets part of that performance by doubling
>the clock freq. I.e the PPC is BARELY faster than an '040 when it is running
>at the same clock speed as the '040.

Hmmm, well most of this applies only to the PDS board, not a logic board swap
which should turn in considerably faster performance on native PPC apps. PPC
emulation of the 040 is the downer being slower than existing high-end 040's.
That's why the blazing speed reports are only for native PPC applications.

Still, give me a Falcon with a 25, 33 or 40MHz 040 in it & I'd be thrilled!!!
A PPC based-Falcon would make more sense, perhaps, but only in the long run.
What makes this discussion relevent to c.s.a.s. is Atari's need to produce
such a beast in quantity and at a low enough price to be competitive. I think
they could do it. Seeing it through to reality is another matter, IHMO.

>Can someone please fill me in on the current prices for a Jaguar package?

As well as some place (in the U.S.) that actually has units for SALE! I could try to finagle one direct from Atari's developer program, I suppose, but they aren't immediately available now either.

Spoke with Bob Brodie last night and he related some supply problems that IBM was having with the units plus some defective graphics chips that they have had to struggle with of late. Supposedly all is back on track now so the Jag's availability should improve.

I _still_ don't equate potential Jag success with 'new and improved' Atari computers, but that doesn't keep me from wanting a new game machine (for my kids, of course). :)

If you have the latest version of the game, why not upload it to ftp.uni-kl.de
or some other ftp site that supports atari software.

I know that I would really like to check that game out.

From: jaszcz@donald.EEAP.CWRU.Edu
Message-ID: <2l5ghk$232@usenet.INS.CWRU.Edu>
Source record: 191710

I'm about to use the Mint Distribution Kit to install mint, etc on my machine, including the minix file system. In the doc's (which by the way are really nicely done) the author didn't really say anything about 32 megabyte partitions. I have an ST with tos 1.04 and a supra 80 meg HD... the supra software seems to be able to handle 32 MB partitions, so, my questions is, if I format my HD with 32 MB partitions will minixfs handle this? (I installed Linux on a firend's PC, and I remember that minix partitions can go up to 64 MB, but it could be different on the ST)...

thanks,
bart

Hendrik_Mylius@pb2.maus.de (Hendrik Mylius) writes:

>What does that mean. Is it a Mint version for Macintosh or am I just going
>crazy ;-)

Yup. MacMiNT consistes of a program called JET which implements 'Just
Enough Tos' to run a version of MiNT which has been modified to use the
Mac Filesystem for file IO. MiNT 0.95 is provided in binary form with it,
but version 1.08 is available as a source diffs file. (Atari's copying
restrictions would not allow a binary or modified source distribution)
Any MiNT or TOS program which doesn't directly access devices should run
for it. Unfortunately, this includes graphics (but not terminal calls).
Note that it runs as just another app in a window in the mac environment.
On the one hand, this means that I can switch back and forth between mac
Apps and UN*X/MiNT/TOS apps, but on the other hand, my mac Apps don't run
under MiNT memory protection, etc. I use it to run GCC/G++, and for fun.
It can be found on suniams1.statistik.tu-muenchen.de, among other places
in the pub/mac/MacMiNT directory

$40 extra and that gives you 16 bit color for 32,000 colors.

>
> Do you have to buy System 7 extra? I think so.

System 7 is included as well as Quicktime.
>
> Still need a 0 wait state DSP.

If you want DSP, you get the Quadra 660 AV 8/230 for $1700. Still cheaper than
the falcon.

From: carrere@galaxie.int-evry.fr
Message-ID: <2l5pca$h9s@reseau.cict.fr>
Source record: 191715

Some details:

- Backward 2.52 should work fully on TOS 4.01.
- it handles sound volume.
- switching Falcon conf can be made while playing (with CTRL+ALT+numeric keypad key)
if somebody have cared about reading the doc, this would have been discovered for a long time.

- Selecting STE bus mode *HAS* disavantages, sound may be disturbed (if it does'nt, you probably won't need ST bus mode).

>a good/modern architecture - if we except this silly 16 bits bus and 16Mhz -
>designed for that (in opposition to PCs, which have a crappy architecture, with
>modern extension cards).

The original post dealt with innovativeness of Atari computers. The availability, the intended market, and price of past or present machines similar to the Falcon are not relevant. The point is that there is nothing in the Falcon that it can't be found in (or added to) another computer.

Compare the raw CPU power of todays computer relative to a 1985 computer. In this category, the Falcon only rates 2-3 times faster than the ST. Is the most popular Mac model sold today only 2-3 times faster than a Mac Plus? Is the most popular PC model sold today only 2-3 times faster than a 286 AT? I don't know the answers to these questions, but I'd guess they are at least 10 times faster.

The ISA is outdated but there is VESA and PCI. It has taken a long time but the PC market is finally shifting away from the need to be compatible with 8088/8086/80286 CPUs. This is because most PC users have upgraded to 386/486 machines. As long as 68000 based Atari computers comprise the large majority of Atari users, 68000 compatibility will always cripple 680x0 based Atari machines (although 68000 compatibility doesn't cripple it as much as 8088 compatibility cripples a 386/486).

This is garbage. System 7, Quicktime, and Apple File Exchange come with *every*
Mac.

>
>Still need a 0 wait state DSP.

The fact is that the 25MHz 68LC040 is at least three times as fast as the
16MHz 68030 in the Falcon. No, there isn't a DSP but there isn't much software
that uses the Falcon DSP anyway. The Quadra 605 comes with the added benefit
of much greater software support and in general, higher quality software.
(Before you flame, I will grant that there are some decent pieces of software
for the Atari. Generally speaking however the quality is not as high.)

Untrue. The PPC601 is about as fast as a Pentium of the same clock speed.
It doesn't just increase the clock speed, it also reduces the number of cycles
per instruction.

The computer isn't an embarrasment, but the company behind it and *definately* many of the users ARE. I read this group because I want to know what's going on with my other platforms. However, inevitably whenever I read here I find postings from people who are obviously highly insecure about Atari's future (understandably) and are forced to bash other platforms to make themselves feel better. THAT is the sort of behavior I find embarrasing.

] If you get Codeheads' free (?) Icon Juggler program it'll load neodesk
] formats and save them as standard NewDesk .rsc files! I used
] IconJuggler and another PD program, MakeIcon, to get my icons just
] right!

But it doesn't save them out as .NIC files, for good ole' Neo-Desk, and
although I don't have TOS 2.06, I'd much rather use NeoDesk 4 than
the 2.06 Desktop!

(Not that I use Icons much except for the occasional one for well-used
programs on the desktop.... Although, I've only got Neo-Desk 3
at the moment, it has an extremely good semi-built-in icon editor so
I don't need to mess around with these other programs, Version 4
should be really impressive!)

:>What dig? None was intended. Heck, I still use DOS, too, when I must.

You made a subtle dig at DOS users being brain dead, the implication was there
I could take big offence at this... but DOS is brain dead... (joke??)

:>>How can you call a Falcon owner 'insecure',
:>
:>How was I supposed to know you own a Falcon? Your post didn't mention it.

:>>I own all Falcon,ste,amiga and a PC(:-)), I like all these machines, but
:>>I don't like MACs, they are the most inefficient machines in terms of use
:>>of power.

I pointed out that I owned a Falcon :-).

:>Hey, good for you. I own 2 ST's, a Falcon, a Mac and I just sold a 486-66DX2.
:>I much prefer the Mac over the PC but that's just _me_, OK? Your mileage
:>may differ and it doesn't bother me a bit if your preferences are different.
:>Personally, I have always thought poorly of Amiga machines but I would never
:>stoop to calling someone STUPID just for using one. What's the good of that?

If you own a Falcon then you probably have some of my demos or utilities.
I won't go into details because it would only portray me as arrogant which
I am not.

:>>What have you contributed to the Atari world then Mr Hutchinson?
;>>Far less than me, thats for *certain* ...
:>Ah, another one of your *certain* facts, I suppose. I salute you, then. ;-)
:>>Over the last four years I have received over 1500 letters congratulating
:>>me on my Atari work from about 30 different countries.
:>We are all very happy for you, I'm sure. :) Again, this is not a
:>contest, Griff. I do not feel the need to list my accomplishments and
:>contributions to the Atari community like some kind of 'resume.' Those
:>that know me know what I have done and that's reward enough for me.

I don't program the Atari for ANY kind of public reward, that is a by-
product, I'm not compelled to compare acheivements with anyone, it
really doesn't bother me, I enjoy what I do a *lot*, you slagged me
down in a big way, suggesting that I had done nothing and that I should
join the real world, your attack was personal, so I defended myself.

:>>Its attitudes like yours that make me want to give up on the Atari scene,
:>Ah yes... the ubiquitous threat to abandon ship. I've heard it before, Griff.
:>Why do people feel the need for this crutch? An even better question... why
:>should I or anyone else care what you do? It's your choice. Go for it.

I'm not bothered about releasing stuff I program, I am one of the only
authors that release source code for their utilities and demos freely.
I happened to mention on a newsgroup that I had ported MPEG to the Falcon,
I had lots of mail about this. Why should I go to the hassle of making
it presentable to other users when it does what I programmed it for?
I also have a desktop tracker in the pipeline and a port of amiga
Protracker 3. I would like a public apology from you for comments
about my 'unworldliness', they were out of order. When I
finish the MPEG port I'll mail it to you and YOU only , and you can
decide whether anyone will appreciate it, after all why should

'anyone else care what I do'? (childish huh? I'd ask anyone you wants
to see some of my new s/ware to mail Mr hutchinson and suggest to him
that he apologises). Why do I bother? I could make so much money on
the PC, I was discussing demo coding with some PC guy the other day
and I suggested that I port the demo to the Falcon, he wanted to
charge me $300 for the source... why do I bother?
I own a PC and could acheive far more recognition on this machine if
that was what I am after, I had mail saying that the PC world had
just gained a major asset, if I am going to be slagged down by Atari
owners for joking about Apple computers then why should I bother,
you slag me down yet are quite happy to use the s/ware I write.

:>> (laughs at the American sense of subtley and irony).
:>And you close with a final stab at my country of origin? Pathetic.

Another Joke ok? Perhaps its your American insecurity which makes you
so defensive, can you not laugh at yourself? (oppps sorry I forgot
you are American (THIS IS A JOKE OK!!!! - I apologise for that but
I couldn't resist it).

:>OK... last try to make you understand. It matters not which brand of system
:>you prefer. That's your choice. What upset me was your callous comment that
:>'Apple computers are for stupid people,' ostensibly because of its GUI. With
:>that comment, I logically inferred you meant the same thing about Atari users
:>(who generally work without benefit of a command line interface or UNIX OS
:>like 'REAL' computers use, to use your terminology). I didn't like that. No
:>one likes being called _stupid_, even in an indirect manner. OK?

Are you suggesting that Atari computers are as 'friendly' to non-computer
users as Macs? Perhaps by 'stupid people' I really mean't 'non-computer users',
(JOKE)!

:>The two things which always set me off are 'piracy' and 'stereotyping' as
:>others here will attest to by experience. :) You simply hit one of my ON
:>buttons, is all. Dissenting opinion is one thing... flames are another.

Yes I think most people will agree that you take things too seriously,
sorry but we leave in a world of 2.2 children etc. Arguments about
piracy make me laugh, at the end of the day people only have X pounds
/dollars to spend.

Yes, Icon Juggler is by one of the CodeHeads (John Eidsvoog), but it isn't P.D., it's shareware ($15 fee) unless you bought their TEC board (then it's free for your use).

Considering that it not only allows you to see, manage, and manipulate hundreds of icons easily; plus maintains their positions so you don't screw up their NEWDESK.INF references (and warns you when you're messing with an icon that's in use); and nothing else I know of does so (i.e., it's unique), I'd say it's well worth the modest fee John is asking.

Hi,

I am a very old user of an Atari 520ST rom set '87. I am looking to find
a source for two things.

One, I would like to get a terminal program that can run PC-ANSI. Does any
one know if PD or SW of this type of program exists?

If it does, and it is on a board somewhere, how would I go about getting it?

Secondly, I would like to set up a SMALL BBs (520ST with Single Sided Drive) for use in my local area (Kanata Canada). Again, is there a half decent PD or SW BBS I could use?

Please E-Mail me at ap508@freenet.carleton.ca

Thanks

From: wells_s@ix.wcc.govt.nz
Message-ID: <2l6f29$bj5@golem.wcc.govt.nz>
Source record: 191726

I've had a good look at this game now, and as it is a reasonably close copy of the old 8-bit game 'Archon', here's the news:

It isn't an Archon _clone_ although a lot of the ideas are based upon it, it is more related to the battle part than the chess-like part.

Archon, for those not-in-the-know, was/(is?) a very popular game on the old Atari 8-bit systems somewhat similar to Chess, but with a difference. When you try 'taking' another piece, you are put into battle mode, and the 2 pieces have to fight it out to the death as it were for the right to occupy that square. Most pieces had different abilities, strengths etc. Some could morph to be a clone of the opposing piece, some could cast spells etc.

Tower-Power still has the different characters with different powers, although the only differences on the game board are the sprites appearance, and the distance the pieces can move (from 2 to 4 spaces).

The game features sampled sound for machines with DMA sound and at least 1meg of RAM, this is the interesting bit, the problem is, very few of the supplied samples can be understood without concentrating quite hard due to them being 6.25Khz, samples and quite 'faded', one of the voices is consistantly clear and easy to understand, whereas the others are virtually all of the listen-hard-or-miss-the-speech variety.

The battle scenes are where it all comes together, some creatures have standard short-range melee weapons (staffs, swords etc.), while others have long-range missile weapons, ranging from arrows to magic bolts that destroy the trees and boulders around the country-side. The 2 characters are each controlled by joystick (Unfortunately, there is no computer controlled players unlike in Archon), and you can hide behind trees and boulders and take pot shots at each-other, trying to strike while the other player is 'reloading', hiding often is a lot less useful if the other player is a Golden Dragon which can destroy your hiding place, and you are controlling an archer which does little more than annoy the dragon....

There can be a total of 4 players, all controled on the game-board by a Joystick in the 2nd port. ^l

Players take turns, and during the battle, a joystick in the 1st (Mouse) port is required for the attacked player to defend themselves.

Some characters have special powers which can be activated by pressing Space or Enter. Such as the Darkness elemental which can become invisible, making targetting virtually impossible for the other player except if you take a shot at them in which case they just follow the

arrows as it were.... For most characters, pressing one of these keys
will activate the characters trade-mark sample (Such as a 'neigh' from
the unicorn, or a 'diiiee' from the 'human' characters)

All in all, it's a brilliant little game for 2-4 players, which has
a fair bit more to it than I've described like having to occupy certain
key-points, and buy reinforcements.

I located this game at:/

ftp.uni-kl.de

in the

pub/atari/Incoming/

directory, filenames:/

towpowpt1.zip Half of the game-disk
towpowpt2.zip The other half of the game-disk
towdata1.zip An optional data-disk with some extra characters, and
a character creator.

It just runs on a half meg machine, runs decently on a 1meg machine, and
fully on a 2meg (or better) machine. DMA Sound gives you better quality
sound in places.

Good fun!

Yes, but it is now being pirated. There are several people I know who use
it and are not registered developers. Beta or not, it is much better than
AES 4.0, Atari should have made it available a long time ago.

Can anyone recomend some good text editors? It will have to be compatible with MTOS (preferably a TOS program) , be reasonablty fast and provide basic file editing capabilities. I am looking for a replacement of the VIEWER.APP that was provided with my Falcon. I would love to have a program like that but with basic editing capabilities.

I just tried out the Revenge Document Displayer 3.1 and liked it a lot but it is not really MTOS 'friendly' (it becomes 'unrully' sometimes and has to be Killed)

Thanks

>control btw the two.
>
>Also, the modem doesn't want to hang up when told to. It just echoes back to the
>remote terminal.
>

It sounds like you may have a flow control problem. It's possible that
the cable you are using doesn't have all the proper control pins
connected...make sure RTS/CTS pins are connected on the cable...also make
sure the modem and any BBS software is set for hardware flow control
(RTS/CTS) and not software control (XOFF/XON)...

To check for pins on the cable one can use an ohmmeter to make sure there's
a connection at a particuliar pin...sorry that I don't know the exact
pin numbers off hand...I believe they're in the FAQ..

Ofir is not even possible to get 24 lines with every thing removed, I have been doing some test will all the Atari terminal programs, Even Stalker 3 can't do it..

The only way is to use a 6*7 Font, and you know what that means....

I use a MultiSync monitor and I have a SM125, I don't like the eye strain that Mono mode gives me, I use it when I have to..

90% of all Ataris world wide would be Colour ones, even in the UK...

So you are cutting your nose of if you don't support Med Res, its a funny thing, I have Script I, and the later German one, Script III does support ST Med Res....

4279. METADOS 2.3 and the Gemini Atari CD-ROM

Newsgroup: comp.sys.atari.st
Date: 1994-03-04 08:09:39 UTC
From: ralph@cerfacs.fr
Message-ID: <RALPH.94Mar4080939@hal.cerfacs.fr>
Source record: 191662
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,fr.comp.sys.atari

A friend lent me his Gemini Atari CD-ROM, so I tried it on my Mega 4 STfm running TOS 2.06, ICD Pro Boot 6.2.0, METADOS 2.3.

When I tried to double-click on a file on the root of the CD-ROM, it gave a alert box with something like "Unable to establish default directory." It worked with directories there, and viewing files in sub-directories. I am using ICD's old ICDROM.BOS v1.0 file since I do not want to use Mint (yet!). What gives?

When I tried to view the files there under gulam, I was able to, but gulam lost its file-name completion. Also, it took quite a while to load one of these files. I would see the CD-ROM light go on, then the computer seemed idle for 30 secs or more, and then a flurry of CD-ROM activity. Any ideas for all this?

P.S. Didn't see any new CD-ROM drivers on the CD though.

>
> Les
>

STOS fix 2.7 seems to take a different approach to previous fixes; instead of trying to fix a program to work on all TOS versions, it reads the system variables from the machine you are running it on and fixes the program to use those. This means that it's no good for making your own programs work on other machines, but very good for fixing other people's programs to work on your particular version of TOS. It was certainly better than BASICMJH at making STOS itself compatible with my TOS 2.06 machine.

I don't know about the Falcon, but as Les says, if it's written by a Falcon owner I would imagine it would work with Falcon versions of TOS, although programs which use extensions may still try to access system variables which aren't covered by the fix.

Source record: 191747

Yesterday I downloaded an old game called Topas from ftp.uni-kl.de. It looks very good; elements of Archon, and some ideas which I was going to put into my own Archon variant (don't you just hate it when someone else has got there first!)

Anyway, this is the PD version, and it's in German, so my questions are:

Why have I never heard of this game before?!?

Was an English version ever written (if not, I guess that answers the first question)?

Are the original authors still around and willing to write an English version, or get someone else to translate it?

Most of the game is quite easy to understand, but from some of the filenames and my limited knowledge of German I get the impression that one of the options is a quiz element, which would definitely be beyond my translation abilities!

IMHO, ~120k for a text editor that does macros and has a programming
mode (CMODE checks () [] and {} parenthesis, as well as auto-indenting)
isn't too bad.

GNU EMACS is somewhat huge, on any platform, but MicroEMACS is named
that for a reason. I think JOVE (John's Own Version of EMACS) is even
smaller.

: "ftp.izs.zi: Unknown host".

Right, so I made a rather huge typo in a crucial place. You are the second
person to have pointed that out to me. The correct address is ftp.ijs.si.
I repeat ftp.ijs.si. Yes that's correct.

: Does anyone know of another, perhaps easier to access, site holding speccy
: snapshots?

Try 'ftp ftp.nvg.unit.no'.

Oh and one final piece of info. Most general Spectrum (emulator)
conversations should go to comop.sys.sinclair.

>
>90% of all Ataris world wide would be Colour ones, even in the UK...

Don't know about the rest of the world, In the UK we just did a survey and
it's about 50/50. However most 'serious' users, and by that I mean the
ones that intend to spend more than 100 pounds on software this year use a
mono monitor.

>
>
>So you are cutting your nose of if you don't support Med Res, its a funny
>thing, I have Script I, and the later German one, Script III does support
>ST Med Res....

All my programs run on any hardware (or at least they're supposed to).
What I was saying is that med-res support will gradually disappear. Don't
know what you mean by eye strain in med-res. I fail to see how 50/60Hz is
better than 70Hz. Or how 640*200 is better than 640*400. Or how having Red
and Green helps in any way.

I work at 880*656 in monochrome most of the time :-)

>All I know is that PC users report that standard Cubase for Windows is
>unusable on a 386. Maybe it's Windows, I don't know.

Ofir, will you quit sitting on the fence? :-)

It's _definitely_ WinDross. If you use Cubase/Win for a while (not that I'm suggesting you do!), you begin to wonder why some operations are very slow compared to a humble ST, and yet some go like the proverbial clappers. Two simple examples:

Take a complex drum pattern, and in the drum editor, select everything with Ctrl-A. Then deselect by clicking in free space. On the ST+NVDI, you get a quick "blink", and it's done. On the PC, you can watch it slowly repainting each and every little diamond from black to white. It's painful to watch.

Select a block of parts in the arrange window, hit Ctrl-K to repeat them umpteen times. Then, whilst they're still selected, delete them. The ST will think hard about this for quite a while, but on the PC they're gone in no time at all.

The reason is obvious. When the excellent Cubase itself is doing the work, the PC's faster processor and 32-bit architecture is a winner. But when it comes to things like repainting screen objects, the multiple levels of WinDog procedure calls and all the other garbage slow the poor PC down so much you wonder whether somebody's installed an "inverse turbo" feature.

You can make things better with a graphics accelerator, or by reducing either the screen resolution or bit-plane depth, but this is all extra money or aggravation which we can all do without. Steinberg are either to be cheered and called a bunch of geniuses for getting Cubase to run under WinDump at all, or condemned as bunch of madmen for even attempting it.

>I don't think Cubase Audio on a PC is a good idea

Can I quote you on that? ;-)

Cheers,

Ian.

Source record: 191664

What to know about handling with GEM-View:

- Cybercube has the exclusive (in the meening of the only one, at the moment) right to distribute GEM-View in North-America (USA & Canada).
- Cybercube can register all interest users in USA & Canada and all people, who have buy anything at cybercube

- Graeme Rutt has the right to distribute GEM-View in United-Kinkdom.
- Graeme Rutt can register all interest users in United Kingdom.

- No other has the right to register GEM-View at the moment.
- GEM-View can put to an utility package on its own disk, if i have it allowed in writing.
ALL FILES MUST ON THE DISK!

- LEXICOR hasn't got any right for register GEM-View. And will NEVER get it in the future!
- From this moment it is disallowed for LEXICOR to handle with GEM-View in any case. NO ansering questions, NO make copies, NO put it on any utility disk, NO registration, NO anything else!

- Im interest to have some other "distributors" in other countries, to make it easier for the people to register. Interest ATARI-Users or ATARI computerclubs prefered. WRITE ME A LETTER!

I'm listening. I read these news groups often just to see what customers think about IBM and it's workstation. I am a programmer, but I want IBM to become profitable again by being an asset to customers, not the cruel user eating monster that you describe. Please tell me any market that IBM owned since 1985? One of IBM's goals in working with other companies to make the PowerPC was to create the next generate of small business, and home computers. Many companies are using the PowerPC CPU to create lots of products. Its not just a ``By the IBM brand computer/product, or you can't buy PowerPC'' attitude.

>But what really infuriates me that IBM has potentially a lot to
>offer (in terms of new developments locked up in vaults) but it
>doesn't do that. And, quite frankly, if I were is such a predominant
>position neither would I. Well... OK, OK, as a non-lawer/non-accountant
>(no offence to either) I just couldn't just sit on neat developments
>without fidgeting... :-)

I work in development and I don't know what new developments we have locked up in a vault. Can you give me some examples? I don't want exact product descriptions, just general information.

My intent is not to anger you. I am honestly trying make a positive difference for my business. I take the comments that I see in the UseNET and show them to management and to the directors of different projects. They do listen. Unfortunately, sometimes the suggestions that I see from the net take major overhauls in organizations and can take years to implement.

I read this news group because my Atari ST is my favorite home computer and this group has lots of excellent ideas.

There is a Tempus Word Junior Demo around.
I got it with the (german) TOS-magazin in Dec 92 if i remember right.

I noone objects (ccd?) i will put it on ftp (ftp.tu-clausthal.de) next weekend (12. or 13. Mar)

It works but has sometimes problems with MiNT.
It's a little like Word for Windows on a good 386 computer.

>You'll probably need at least 2 Meg for processing any serious document,
>and you definitely need a harddisk.

Anyone know of a US distributor of this package. The CS-TeX version I
got of the atari archive 1.5 years ago was great, but I bet the commercial
version is purely awesome. If I can afford it, I'm getting it. I'll be
glad to review it.

By the way, some kind soul sent my TeX Installation guide back to me after
I lost my backups, harddrive, and 97% of my ST (case didn't completely melt).
But could you sent it to me again? I'll be glad to repost it so that people
who are miffed about there being now TeX Installatin Guide for the PC won't
be miffed any more.

Hello,

I was wondering if anyone remembers the wonderful game called
getaway from APX? I don't remember the author, but I have it
back home with all of the atari 400 stuff.

I was wondering if anyone has made a game for the ST/TT/Falcon
series of computer that is similar to this. I thought, and still
think that it is an awesome game. If anyone know of a game like
it, please let me know, either the newsgroup(that way everybody
could learn about it's existence), or via e-mail, and I could
let the world know later of the quality of it.

Thanks,

Joseph

4318. Looking for Calamus fonts: logical symbols and Hebrew

Newsgroup: comp.sys.atari.st
Date: 1994-03-04 19:42:03 UTC
From: A6101GAO@AWIUNI11.EDVZ.UniVie.AC.AT
Message-ID: <16F6F1150B.A6101GAO@AWIUNI11.EDVZ.UniVie.AC.AT>
Source record: 191673

I am looking for a Calamus-font of logical and mathematical symbols. Of course the font should either be cheap (and available in Europe) or public domain and available by ftp.

Besides the mathematical symbols I'd be interested in a Hebrew Calamus font.

Thanks in advance,

Christian

>I (and all others here i Norway) has always considered Germany as
>Atari's biggest stronghold in Europe (almost everything hardware and
>software available is german). How in the world can Atari close down
>their German office - I would see that as a good suicide attempt !!!

So is it a problem or not ? I think there were lot's of problems at Germany HQ after Alwin Stumpf left Atari. Then last year Norman Kovalewski (german support) left germany to join the developer crew at Atari USA in Sunnyvale. But we have a very good new man from Holland, Wilfred Kilwinger. He is also very active in the german MausNet.
But back to your statement: First of all for the normal user there are no changes, there should be no changes for the dealers because holland is an EU member and therefor it's no difference if hardware is delivered from Schwalbach in Germany or from Holland. Developers can phone Wilfred over a german number so you don't have to pay for a longe-range-call. Europe is going to be united, borders (economic ones) are falling. Why should Atari have 5 HQ's in Europe when in this time of economic depression everybody has to handle carefully with money. So look at the USA: it is much bigger than Europe and as I know there is only one HQ in Synnyvale.
My dad is running a sports-shop, we also have products from adidas this is one of the best known companies in the world and also a german one. They had some smaller distribution centers beside the HQ in germany, but they were all closed now, other companies did the same. This is only a example that not only Atari has to rightsize themselves.~

>this purpose.

Forget the CD32 ads. I saw TV advertising on german TV, it's so weired, the only thing you can do is laughing. The print ads are everything else than something special. I saw a 4-page ad for the Jag in a US-mag and i was impressed that Atari can do such good ads !

OK, I have TWO apologies to make:

1) To M.D.Grffiths (mdg@ukc.ac.uk). Griff and I have been raging a silly
debate and mud-slinging contest of late which was doing neither of us any
good. We finally chatted it out via a 'talk' sequence (ain't technolgy
grand?) and got things settled between us. So to make it official:

Griff -- I apologize for the tone and content of my previous messages.
While the intent was not to be a personal attack on you, I can well
understand how that could have been perceived. You have every right
to freely express your views in this newsgroup, and if you or anyone
else wishes to 'slag' (gee, I love that term) any non-Atari computer,
then what better newsgroup to do it in than comp.sys.atari.st? My
apologies are extended as well as my 'cyber-hand' in friendship. OK?

2) To all readers of comp.sys.atari.st. I wish to apologize for wasting so
much bandwidth on a really insepid argument, especially one that was not
even directly related to the topic of Atari computers in the first place.

Yep, I was in error. But grant me the credit of acknowledging it, OK?

Thanks.

Now then... just where did I put that Prozac, anyway? :)

-Hutch- @ Fair Dinkum Tech

PLEASE NOTE: As my newsreader is down for the moment and I am unable to
post messages from my own account, please ensure any email replies are
sent to hutch@ilmen.lanl.gov. Ta.

From: dowdle@delphi.com
Message-ID: <5lyl-Qx.dowdle@delphi.com>
Source record: 191688

Joe LeSesne,

To the best of my knowledge, NO version of STalker is pd or shareware. Eric Rosenquist (to the best of my knowledge) sold the rights to the program and the source code to Gribnif Software... who has recently contracted someone to work on an upgrade... and I hear it's actually in beta-testing phase already. I suggest, assuming you can financially afford it, that you buy the current release version of STalker because it is rather good.

TYL, Scott

4333. VOX-Mail voice-mail system released!

] >of its faster CPU.

Someone I know had a ~50Meg Quantum drive, and compared its speed with
a 386 at ~30Mhz with the exact same model drive, and the STE wiped the
floor with the PC! Times on the STE were about 30% faster than the PC!

Due to a simple reason, despite how many there are, PC's ALL have
very bad architecture, if one turned up with _good_ architecture, it'd
probably be very incompatible! This is because they are essentially the
same as the original XT's that turned up over 10 years ago, with the
same bits, just running at a faster speed! (And with 'larger' bus
sizes etc).

Despite the fact, I'd still just as soon have a 486-DX instead of my
1040STE, or a nice A-5000. If I got desperate, even an Amiga avoiding
the modes with flicker, would probably do what I want!

Completely off topic, but there you are! :)

In a previous article, whitema@rtsg.mot.com (Michael A. White) says:

>
>Pray tell us, what are these settings (not an advocacy post, I do wish
>to know).
>
>Michael
>whitema@rtsg.mot.com
>

Well this is basically all I know of as far as speeding up the response under MTOS goes.

First of all you need the PS CPX module. This will let you set the priorities for all the programs in memory. The lower the priority for the AES is the better the response is. As far as applications go you can adjust that to so that you can run a lot of programs and still have decent response time on your main application. Set your 3 or 4 backgrount task to a low priority relative to your important programs which you switch between in the foreground and all of a sudden MTOS becomes really usefull!

The second thing you can change is the MINT.CNF file
the line SLICES=<some number> determines how much time is given to each process before going to the next one.

There is also a variable you can set that will use Hardware scrolling to speed up the text output by as much as %300. I have not figured out how to enable it yet. Does anyone else know how to do this?

You can also assing different utilities for desktop functions so tha when you double click on a text file you favourite text editor will be used instead of the VIEWER.APP. The same goes for the copy and format functions on the desktop.

In your GEM.CNF file changes these lines:

```
setenv ShSHOW=c:\MULTITOS\VIEWER.APP
setenv DESKCOPY=C:\MULTITOS\COPY.PRG
setenv DESKFMT=C:\MULTITOS\FMT.PRG
```

there are also many other variables which I do not know what to do with yet.

There are also keyboard commands for certain functions:

Control+Alternate+Tab switches between programs
Control+Alt+\ kills a process (this should be avoided if possible. use SIGTERM from the PS.CPX or delete the process from u:\proc\ )

Control+alt+z suspends a process
Control+alt+Fkeys does a great many things I can't recall at the moment.

There are propably more so please share the information. Nothing is too trivial!

It would be nice if someone from the c.s.a.s.tech group took some time to educate some of the less knowledgable.

This TeX package is called MultiTeX, not CS-TeX. CS-TeX is freeware,
MultiTeX is commercial.

To be fair, there are *many* more colour users in the UK - the difference,
I believe, is that a lower proportion try to use them for anything serious
than in the US. Maybe I'm wrong here, this is just how I see it from
hanging around various Atari related comms places.

What you say is true - all serious programs should try to work in all
available modes. With the possible exception of ST low - where it's
impossible to display a decent sized dialog box. This isn't much trouble
to a GEM programmer, all he needs do is cut his icons in half (vertically)
for ST Medium and his dilog box should look okay.

Utter nonsense! Well, maybe not so much when it comes to the UK because it appears to be a games market more than anything (remember how long it took them to go from cassette based systems to disk) but in Germany, Sweden etc. monochrome still rules! But not on the Falcon of course, which has VGA or better. I suspect that med-res support will gradualy disappear in serious applications. It has a weird aspect ratio anyway, which makes everything look ugly, even the desktop!

The Germans are coming out with an interface called "Heatseeker" which will do the trick (and several other neat tricks as well if I remember correctly). I can't remember offhand who's doing it - Overscan or ROM maybe. Now if those ST Computer mags were here...

Jon

Or get PSControl 2.0, an app recently uploaded to the various archives. It's simply the neatest looking process controller I've seen. It knows about iconifying for those who have AES 4.1 too.

>There are also keyboard commands for certain functions:

>Control+Alt+\ kills a process (this should be avoided if possible. use
>SIGTERM from the PS.CPX or delete the process from u:\proc\ )

Selecting the app/accessory in the menu listing whilst holding down control will also do the trick.

Jon

To be fair about this, the program has been well received by people who
have used it. I know the author personally and, while I don't use the
program (I already owned Diamond Edge...) would not be uncomfortable with
using the program to defrag my own drive if I were in need. If you are
concerned about it, you may wish to verify that this uuencoded version
posted here was the latest version currently available on GEnie or atari.

>the SM124 and SC1224 (or equivalents) the SM will be easier on the eyes.

Yup - that's the problem, innit? I've just got hold of a fairly cheap SVGA monitor, which gives me reasonably high quality colour. It's a galaxy away from a RGB monitor in ST Med. I'm still using it in monochrome quite a lot of the time though - some of the programs I use can't run in much else (Calamus 1.09n) and some of them run too slowly (for me) in colour modes (cixread, my OLR, for instance). And some of them are excellent in 16 colour - Protext, for instance.

>I use a MultiSync monitor and I have a SM125, I don't like the eye strain that
>Mono mode gives me, I use it when I have to..

As I've just said to Hutch, I don't think many people would argue that working in hi-res colour is better than hi-res mono (speed/program limitations aside). However, working in 4 colour medium res is going to cause you more eyestrain than in mono - it has a higher refresh rate, is more stable and the double pixel height makes everything much clearer. I'm sorry but you're talking nonsense.

>90% of all Ataris world wide would be Colour ones, even in the UK...

True... but what percentage of them are used for anything but games or the very occasional letter etc?

>So you are cutting your nose of if you don't support Med Res, its a funny
>thing, I have Script I, and the later German one, Script III does support
>ST Med Res....

How did we get from Ofir saying that Hi-res mono is better than Med-res 4 colour to you suggesting that he should support medium res? All of his programs work in med res. Maybe you should think or find out some pertinent information before mailing in future?

> - Graeme Rutt has the right to distribute GEM-View in United-Kinkdom.
> - Graeme Rutt can register all interest users in United Kingdom.

That's me. Although can I ask any interested UK users to send me both a formatted disk (82 tracks, 10 sectors) and a stamped addressed envelope capable of taking the disk. This is *only* in the case of people who'd like to see the latest shareware version (currently 3.02). Those of you sending me your 18 UKP needn't send me anything but a cheque, the name they'd like to register under and their address. The disk, postage and packaging are all included in the price.

Can UK users also note that GEMVIEW is available from the Floppyshop PDL - if you get your copy from there it's guaranteed to be the latest version. Other UK PDLs carry older versions of the program (without Dieter's consent) but I'm trying to dissuade them from doing so.

My address is: 4 River Terrace, Washbank Road, Eynesbury, Cambs., PE19 2TE

Floppyshop's address is: PO Box 273, Aberdeen, AB9 8SJ, Scotland

If possible, can I ask you to send for shareware copies of the disk to the Floppyshop - I make no money from anything to do with GEMVIEW (at my own request) and only have a limited amount of time each day. Under no circumstances send your 18 UKP for registration to the Floppyshop though - they only distribute, they can't register.

Thanks for you time and apologies to non-UK readers.

I have compiled PGP 2.3a for Atari with the available source-code changes/
additions of Steven Ourada (sourada@isstate.edu). All PGP-stuff is
available from ftp.tu-clausthal.de (139.174.2.10) in the directory
/pub/atari/misc/pgp you will find the sources, the Atari-sources,
the docs and two procompiled binaries (both compiled with GCC, one with
GNUlib the other one with MINTlib).
Access via FTP, FSP (port 21) or Email ("mail-server@ftp.tu-clausthal.de").

Bye,
Wolfgang.

I'll second the notion that EDHAK is an excellent program. Not only
does it allow you to edit text and binary files, but it makes a nice
"online editor" that you can use to send the output to the modem
(for instance, during a GEnie conference, I type my question ahead
in Edhak, and when it comes my turn to ask, I simply "upload" the
Edhak buffer).

And since it supports the clipboard, I can drag over some text with
CoNnect (which copies the chosen text to the clipboard) and then
just copy the block into Edhak...

Rob

...if I'm correct, the demo version limits you to 2k buffer, but the
commercial version is not limited by this,..

50/50 in the UK according to a readers' survey, in case you've missed my
first post. All Cubase and Notator users have monochrome monitors as well
as anyone using the ST for DTP. There is nobody on CIX running in
med-res as a prefernce. As I said before med-res support will gradually
disappear and at best only added as an after thought.

Hello all,

I wish to thank everyone who responded and offered help if I further needed it. Most everyone told me to get Christoph Strunk's CS-TeX. I was told its almost impossible without a hard drive. Unfortunatly, I don't have a hard drive. But that won't stop me from trying. I've done some fancy floppy disk setups to get things I wanted, notably a UUCP connection and a bulletin board system. I think after all the help I got I'll get something setup. I'll email separately to those people who wanted exact discriptions of how to setup a TeX system once (and if) I get a system working.

MJP>lzh files, do I have to do something to these to make them work??
Simple thing:
Get LHA_299.TOS (Selfextracting archive). The LZH-files are compressed data for faster transfer and less discspace. Just like *.ARJ, *.ZIP, *.ZOO a.s.o.
The LZHs are files compressed with LHarc, a packer that is supperted on several machines (DOS, Amiga, Atari ...). The Atari-Version actually is made by Christian Grunenberg, who made it quite fast compared to the older versions.
Should be available via ftp (but don't ask *me* where to get it from).

A Shell is included in the LHA_299.TOS-archive too

I am tired of seeing med-res users and game players mocked by folks like ofir.

Where does he get off telling us the Civilization is not 'serious'?
What the fuck does he do that is so damned 'serious' with his machine.

A point of info for those afflicted with this kind of techno-arrogance:
I originally bought my ST (still running TOS 1.something) because I
like Macs but couldn't afford one. I am using my ST now to write
my dissertation on the Frankfurt School and to surf the NET because:
I can't afford a PC.

Now: a mono-monitor would make my life easier in some ways, but there is
no way I am going to put another $100 plus into hardware for this thing,
I honestly, truly *do not have room* for two monitors.

Tell Ofir he's invited to come over & get his butt kicked at Speedball ;-).

Love,

My comment was more an oblique moan about the uuencoded version appearing
here at all - isn't there a binary newgroup for the Atari?

An English version of 3.2 (the latest is out for beta test). These days
development of German and English versions goes on simultaniously.

As far as I am aware it will do Degas files as well as the ones you list.
Version 1.06, which will be commercial, has a few bug fixe and works as
a CPX. At the moment though it bombs out even more times when changing
resolution. The author was going top sell the new version via Maxon in
Germany.

That might be very slow, depending on how your shell handles
redirection; why not just:

gzip -d -c net-xxx.tgz | tar -xovf -

For those who aren't familiar with tar, 'v' means 'verbose' so you'll
know it's actually doing something, and 'o' means 'owner' so the file
owner/group will be changed to _you_ while extracting. This is only
needed on filesystems that keep track own group and owner (like minixfs
under MiNT or most UNIX filesystems).

It appears that my last message was lost in netspace so once more, here is the adress where you should send your requests for an email subscription to AEO: stzmagazine-request@virginia.edu

Someone asked me about a more specific adress to Greg Lindahl who runs this service but afaik it is the same as above. Correct me if I'm wrong.

Btw, why don't Atari set up their own subscription service? Not that Greg is doing bad but sometimes issues arrive late and besides someone with more resources ought to relieve him from this mammuth task.

From: mbridson@morgan.ucs.mun.ca
Message-ID: <mbridson.762970746@morgan>
Source record: 191644

I'm currently using Sozobon C, delving no deeper than GEMDOS, BIOS, and XBIOS calls. However, this is not enough for what I want to do. I found a GFA-BASIC command L~A which returns the address of "the Line-A variable", with which you can get data about the screen (in terms of text)... I tried to trace a compiled version of a program using L~A, but couldn;t figure out what it was doing. So my question: how do I access this from C? What is GFA-BASIC actually doing?

Please e-mail me at mbridson@morgan.ucs.mun.ca rather than posting.

P.S. I'd really appreciate it if someone could tell me BDOS (trap #2) is.

I've uploaded Space wars 2000 onto atari.archive.umich.edu and
ftp.uni-kl.de
Unfortunately I've just realised that I forgot to run the STOS fix program on
it. So I'll upload a new one sometime later in the week.
For those with TOS >1.62 who can't wait, the SWAR2000.PRG is packed with
ice 2.4, so mega depack will uncompress it, then you can run STOS fix on it.
Sorry for any problems this may cause some people.
btw can anyone inform me of how the game runs on an accelerated machine?

The documentation with my copy said that the control panel had to be
"shut down" before a resolution change if the OS didn't support
certain features (which ones, it didn't say). I think it mentioned
about 2.something as being the first version where "shut down" wasn't
needed.

Vij> this???

Wow... Have you been snooping around my mind or something???

I also have a MegaSTE and will probably, by the end of the week, have AW/SG and Geneva (though I guess ND4 isn't out yet, right?). I was wondering the same thing! Apparently there IS another version of AtariWorks in the works which will have a terminal emulator built in and some extra bits in the word processor, from what I have picked up. Anyone know about this? I'll probably go ahead and get AW1.0 but I hope Atari will have a decent upgrade policy!

Also, what's the word on the updated version of Geneva? I heard it'll work with MiNT and/or PowerDos... Anyone have any news? And what's the deal with NeoDesk 4?

And finally, what's the word on the updated, faster, AES4.1 MultiTOS? When, where, how much?

Thanks 2!

Really glad to hear from you again! I can see that NeST is still running
strong... keep it up!

VOX-Mail is a voice mail system that I designed for the Falcon. It has a
hardware interface to the phone lines as well as a fully GEMmed software
to recording/playback messages. At present, it functions fully as an
anwering machine with incoming messages directly recorded to hard disk.
I am working on adding touch-tone detection and other nifty stuff to
VOX-Mail.

You can ftp the file and have a look at the software. I am using
VOX-Mail as my answering machine on my Falcon right now.

Take care!

Dieter> disk, NO registration, NO anything else!

I'm curious as to what caused this outburst. Has Lexicor screwed up?
I've never heard of anyone with any complaints about them in the
past... Also, I hadn't heard that they were even thinking of
distributing GemView. From Dieter's tone, it sounds as though they
were stealing shareware fees or distributing registered copies or
something! I REALLY doubt the guys at Lexicor would do that!!!

Perhaps we have some politics going on here between Cybercube and
Lexicor?

>their German office - I would see that as a good suicide attempt !!!

I - as a German dealer's employee and a registered developer - see no changes for me as a developer and an improvement for dealers.

The hardware comes from Atari Europe, Vianen, The Netherlands, ever since this "European Distribution Center" was opened about a year ago. Now, dealers' orders go there directly. The German office just was an eight-people German speaking interface to Vianen, which is gone now - as the people over in Vianen speak German fluently, there's no problem in getting information, and less problems than before in getting products delivered.

> I just fail to see how this can possibly slow down the Jag...

But, that has nothing to do with the point I was making. _If_ the Jag
were a computer instead of a games console, the 68k _would_ be the CPU,
and it _would_ be inadequate for most computer tasks these days. And I
say that typing on my 8Mhz 68k ST, which is more useful as a _computer_
than the 13Mhz 68k in the Jag would be, since the ST doesn't have to
drive as much video bandwidth, etc...

_If_ the Jag were a computer instead of a games console, its performance
would be rather pathetic in the face of Falcon030s, TT030s, '486s, '040
Macs and Amigas, and any RISC CPU. It would be faster than my ST, but
who would buy an ST-speed computer _today_ unless it was used and very
cheap?

It's not relevant which language is spoken by `most of the world'. I think
that the majority of *Atarians* understands german well enough to figure
out some program documentation.

> So come on you Germans you have some great software, but its no good if its

If you were really interested in the software you could always learn a bit
of german.

> What makes this discussion relevent to c.s.a.s. is Atari's need to produce
> such a beast in quantity and at a low enough price to be competitive. I think
> they could do it. Seeing it through to reality is another matter, IHMO.

I think to make a competitive FalconPPC, they'd need to improve several
areas:

1) Graphics - the Falcon's "standard" resolutions are barely better than
VGA; sure, more colours, but I need more _space_, at least 800x600x256
out of the box, without software/hardware hacks

2) Expandibility - people want to be able to add more RAM just by
popping in a few SIMMs... no fiddling with strange add-on boards, and no
limiting you to 14M. A PCI slot or two, for later when PCI peripherals
become more commonplace; they're already becomming more popular in '486
and Pentium systems, and they'll be a big player in the PPC world.
SCSI-II instead of IDE; that will allow more expandibility, and allow
for systems with CD-ROMs as standard.

3) Style - lose the damn 1040ST case. It's a big pain to set up on your
desk with a monitor or two; IMHO all computers should have the keyboard
separate from the case. They could even consider using a standard ADB
or PC-style keyboard connector so people could pick the keyboard they
want (although I do like the ST keyboard).

4) Models - offer more than one model. Offer the "standard" 4M RAM,
100M disk version; offer an "enhanced" 8M RAM, 200M disk version; offer
a multimedia version with 8M RAM, 200M disk, and SCSI CD-ROM; offer an
"enhanced" multimedia version with 16M RAM, 500M disk, and SCSI CD-ROM.
Dealers could offer models with larger RAM/disk than these versions as
well, so there should be a 0M RAM, 0M disk version available only to
dealers; this will allow them to produce "custom" configurations that
are cheaper for them to make than Atari's standard configurations,
improving the outlook for dealers as well as customers.

5) Perks - ship each system that comes with a CD-ROM with a copy of the
GEMini Atari CD-ROM; such a huge collection of PD/SW/whatever software,
people will have a much rosier outlook on their new computer... they'll
have plenty of software to play with, and plenty of things for
commercial software that they could buy (for example, there are a tonne
of Calamus fonts on the GEMini CD). This should be "free" with the
system, since the disc is only about $30 US.

Gee, looking back, all that seems like a bunch of good ideas, especially if Atari is flush in a year due to the Jaguar. Then again, we all know:

1) The Tramiels don't listen to good ideas from any source.
2) Jaguar success will probably enforce the idea that Atari is finished in the computer industry; they've tried for so long to have a successful computer, but their game console was an instant success...

Maybe Commodore will do something like this; I have no foolish desire to limit my future due to some sort of brand loyalty.

This is why I start to froth at the mouth so easily when it comes to
Atari; they've treated us like morons for 9 years now (gee, my ST is 8
years old!) and people _still_ blindly advocate for them.

Sure I like my ST (otherwise, why would I still be using it?), but I
can't figure out why people go nuts when someone complains about Atari
or their computers. They've gone out of their way to alienate their
loyal users and dealers, and have made no steps to improve relations
with either. I'm certainly no genius, but I sure think I could run a
computer business better... then again, I've never been handed a
multi-million dollar business to play with.

EdHak has a slight problem though... It can't deal with UNIX-style
end-of-lines in text files.

This isn't a big deal for most users, but if you transfer lots of files
to/from UNIX systems, you're out of luck.

Regardless of what monitor resolutions that programmers SHOULD program for, in the past, the application usually dictated what monitor you initially purchased. If you got your Atari for games, games where largely written for colour monitors. Applications such as Calamus, Cubase, Notator,etc were written for ST High res. Most people buy because they like what Cubase can do for their music setup-if the monitor needed to run Cubase is mono-so be it. Having said that, I like the idea of a wide range multi-sync that handles it all from ST Low to SVGA and above.

Dateline Atari with Bob Brodie
March 4, 1994

with Special Guests

Tom Gillen, Hank Cappa,
Joe Sousa, Faran Thomason

Host - Lou Rocha

--------------------------------------------------------------------------

<TOM.GILLEN> Hello everyone! My name is Tom Gillen, and I am the Software
Test Group leader here at Atari. I am thrilled about being on GEnie, as
this enables me to communicate directly with the people that mean the
most to me; the ones that support Atari! I have been with Atari since the
Warner days, and have always been involved with the Software Test side of
things, as well as a little bit of Hardware testing. I have tested
Software on everything from the 2600 to JAGUAR, and I'm still not tired
of it!! I love what I do, but there are other people that help complete
the picture, and two of them are here with me tonight;

Joe Sousa and Hank Cappa are two of my testers, and let me assure you
that the Test Department here at Atari is quite a competent bunch! Our
testing procedure consists not only of "play testing" for program bugs,
but also providing the Product Managers and Developers with game ideas
and enhancement suggestions, many of which have made their way into many
different games. Our focus for quite a while now has been the JAGUAR, but
we are still testing LYNX games as well. As far as FALCON software, the
testing and development has been moved to the UK, but I still have a
great personal interest in seeing the FALCON succeed. My computer setup
includes a FALCON and a TT, both of which I love, and am always hungry to
do new things with (anybody seen the TT VGA emulator for the TTM195?
WOW!!). I will freely admit that I am no computer "know it all" that can
recite all the specs at the drop of a "chat", and have acutally learned
many things myself by scanning the ST message areas here on GEnie (love
```

em!); but if and when I can help out with computer related questions, I will! I would now like to introduce Joe Sousa and Hank Cappa, both of whom will have their own GEnie accounts soon, and are eager to help out with the Atari presence in the message areas. Thank you for being there, and I look forward to participating here on GEnie!

So does this mean the death of the FALCON..???

>Try it!

I got it cause I thought it might be nice to have a program that could read RTF. I tried it with several files and wasn't very impressed. It imported my STWriter files bys imply stripping out the formatting codes instead of reformatting it. It imported an RTF file from WordPerfect 5.2 for Windows with no formatting info. It even missed some of the characters.

I'll stick with STWriter until I can can find something better that suits my needs. I want something better, but STWriter allows me the flexibility to put formatting codes to adjust things like margins within the document.

If I could find something with the flexibility of STW, with print preview and support for graphics and such, I would be happy to look into it. Any suggestions?

From: gustavo@dent.uchicago.edu
Message-ID: <1994Mar7.065342.22463@midway.uchicago.edu>
Source record: 191499

HI,
I have just tried out Photochrome v.3, and I am truly impressed with the quality of the conversion (especially in the enhanced HAM mode). However, I am having trouble with the picture viewer PSCLICK.APP and the slide-show PCSVIEW.PRG. PSCLICK.APP does display the picture all right, but I haven't been able to figure out how to exit the program (short of doing a warm boot); OTOH, PCSVIEW.PRG does not seem to work at all. Can anyone offer any tips?

Thanks in advance.

Gustavo

4430. New Dungeonmaster like clone: Dangimere Module II

I just uploaded module II: The Dungeon to atari.archive.umich.edu
it's a 'demo' of module II of the Dangimere RPG series. If you liked
Dungeonmaster, you'll probally like this.

Filename at arari.archive.umich.edu: dandungn.lzh
Currently it is in the /atari/New/ directory so hopefully it'll move
to the /atari/New/Games/ directory soon...

enjoy...

Hi There,
I just bought a DeskJet 500, I'm very happy with it, but
I really miss the driver for 1st Word Plus, I'm asking it here
because I bought 1st word second hand, and the original dealer no
longer exist (anyway forget support on second hand purchase down
here in Italy..), actually Atari Italia does not exist anymore,
PD libraries should be the solution, but since they do not accept
credit card buying a 2$ (or UK pound) disk will cost me a fortune
(yes, here an international money order/cheque is about 15/20 $!!)

SO, could a kind soul give/exchange the 1st Word DJ driver to me ?

Thanks a lot,

Savino

Oh come on! Modern software is more then just the executable file.
Consider complex packages such as Connect. If you want to get the
best out of it you have to read the manual. That's what it was written
for, BTW. :-)
On the other hand it is quite an effort to rewrite the whole program
(including the docs) in another language.
Therefore if the market demands a program the author should offer
an english version. But our english-speaking friends should then be
ready to pay. Everyone will be satisfied then.

Regards
Thomas

Source record: 191588

Ross McNaughton (mcnaugra@vax.sbu.ac.uk) wrote:

: Yesterday I downloaded an old game called Topas from ftp.uni-kl.de. It looks
: very good; elements of Archon, and some ideas which I was going to put into my
: own Archon variant (don't you just hate it when someone else has got there
: first!)

I'm sorry, I know that feeling... ;-)

: Why have I never heard of this game before?!?

First: Maybe because it's german and
Second: This game (in the actual version 1.2) is Poolware! I have made a
contract with IDL Software which sells the game with ~20 PD-dealers through-
out germany. They give the author 20% of their profit. And there start the
problems: It is forbidden to spread the actual version of Topas via internet
(or any other net).

: Was an English version ever written (if not, I guess that answers the first
: question)?

No.

: Are the original authors still around and willing to write an English version,
: or get someone else to translate it?

I was talking to Greame Rutt just a few days ago. Maybe there will come a
english version soon, BUT it can only be a Demo-Version (read above)!

: Most of the game is quite easy to understand, but from some of the filenames
: and my limited knowledge of German I get the impression that one of the
: options is a quiz element, which would definitely be beyond my translation
: abilities!

Yes, there are ~3000 questions with ~12000 possible answers in the game.
(erm...in the actual version... the older version on ftp.uni-kl.de has only
500 questions).
You can turn the questions off by clicking on the "Fragen"-Button in the
first dialog.

Note: The Pre-version on ftp.uni-kl.de does not run on TT or Falcon. The
actual version does!

Ciao, Heiko.

When you want to make a great program, you should start with an english version, don't bother about a german version. If you put a lot of work into a program make sure that your work will be appreciated by other people in the atari community otherwise it is a bit of a waste. I am from holland, but all my program/docs/manuals are written in english, I never make a version with dutch texts.

4449. Mega STe vs 1040 STe

Newsgroup: comp.sys.atari.st
Date: 1994-03-07 13:44:03 UTC
From: whitema@rtsg.mot.com
Message-ID: <2lfb33$hvf@delphinium.cig.mot.com>
Source record: 191595

I've currently got a 1040 STe with an AdSpeed STe, and was thinking of buying a used Mega STe. Is there a way to manually switch the Mega to 8 MHz like the AdSpeed? How compatible is it compared to the AdSpeed (I lost very few games when I upgraded to the AdSpeed)? Will I lose any due to the high density floppy drive? The reason I want a Mega is for the expansion slot (I need more screen space).

Thanks,
Michael

Pressing the RIGHT mouse button should exit PCSCLICK although it sometimes
makes my STE think I'm holding down the Escape key when it returns to the
desktop, so I have to press Escape to shut it up.

As far as I can tell, PCSVIEW only runs in the root directory of A drive,
which is not particularly useful. Press, um, Space to exit... possibly.

Photochrome is well worth the registration fee in my opinion. I've got a
number of pictures in the STE 19700 colours PCS format and they are totally
convincing - photographic quality if you stand far enough away.

The only things I'd like added are more import file formats and some better
resizing options. Maybe when Douglas Little can spare some time from playing
with his Falcon (albeit in a highly productive manner!) he will return to
give Photochrome a few finishing touches. (Are you listening, Douglas?)

Richard.

Newsgroup: comp.sys.atari.st
Date: 1994-03-07 14:14:02 UTC
From: Willem@rc.rug.nl
Message-ID: <Willem.51.763049642@rc.rug.nl>
Source record: 191598

G'day,

I have an Atari 1040 STf (B&W) at home, but I work here on a PC.
The Atari has problems, (can't open documents with 1st wordplus among
others). I suspect the disk drive to cripple my disketes, but maybe there
are other possibilities (like hardware problems, virus ?)

Could somebody tell me how i can check the system out myself (1st how do I
download the info, can I use 720Kb DOS diskettes, should I dis-arc and uue)
them on my PC, etc.)

T.I.A.
Willem.

P.S.
Please answer to me directly.

4454. English text editors found; Thanks a lot! :)

From: ac382@FreeNet.Carleton.CA
Message-ID: <CMAt2L.H2F@freenet.carleton.ca>
Source record: 191415

In a previous article, Arndt_Baecker@w.maus.de (Arndt Baecker) says:

>In Msg A29467@AC2, ac382@FreeNet.Carleton.CA wrote:
>
>JK>Does anyone have an English version of EVERES3, QED310 or 7UP210? All
>JK>of these seem like decent editors but like the tittle says they are
>JK>all in German.
>
>how about learning german? :-)
>here in germany we have to learn english in school. which language did you
>learn? french? russian? japanese? :-)

Polish first, then English, then a little French (very little but usually
enough to get by the French programs:).
You are propably right though, it is a good idea to learn German
especially if you own an Atari :)

Anyway many people have replied and I have received a couple of uuecoded
files as well as ftp sites with English versions of some of the ediors.
So far it looks like I'll be sending in the fee for Everest. It is very
fast, small and has loads of nice features. If the author is reading this
I would like to make a suggestion: add an option that lets you use the
keypad to control the cursor, Pgup, Pgdwn etc..(like in Devpac).

Thank you very much people. Times like this make me really happy to own
an Atari. Even though it is sometimes an inconveniance to have only a
German version of a program, the users users are really great and provide
you with SOLID support.

Thanks again.

: are lzh files, do I have to do something to these to make them work??

: Do I need additional software? Where can I get it?

Hi :-),

the files on ftp-servers are normally archives that have to be unpacked
before they can be used. Some are selfextracting .TOS files but in general
you need special archiver programs which are on the net, too. Try ftp-server
ftp.uni-paderborn.de (131.234.2.32), path atari/tools/packer. There you
will find arc6_02.ttp for .ARC files, lha_232.tos for .LZH/.LHA files,
stzip24.tos for .ZIP files, zoo21bin.lzh for .ZOO files and some very nice
archiver-shells, e.g. twoin103.zip and pacsh240.lzh, which are very useful,
because archivers need lots of parameters (.TTP!).

From: mkite@lincoln.gpsemi.com
Message-ID: <CMB0L6.AF2@lincoln.gpsemi.com>
Source record: 191456

Hi,

Now I know everyones got their favourite DTP, but why ? that's what I want to know ! Basically I've used Timeworks 1, and was thinking about getting 2 but then I got Caligrapher(?) on the ST Review cover disk this month and for the same money I can get the manuals and a few paks, but which is the right decision ? Or is it worth spending more money on a more up market package.

Oh yeah - I got a Mega STe with 2Mb of memory (soon to become 4), a 105Mb hard disk and a Panasonic KX-P1123 24 pin dot matrix printer, though postscript output to file would be good as an alternative as we've got them at work.

Any thoughts - email or post but I'll summarise emails if there's enough of them.

>posted here was the latest version currently available on GEnie or atari.
>archive...

Actually, I just downloaded it together with approximately another
megabyte of diskutilities to 'check-em-out', and found Blitz
userunfriendly (it required the user to know how the file system works,
which is no problem to me, but you can't expect all users to know anything
about FATs and clusters...) and it wasn't at all very self-explanatrory,
meaning that even I, with full documentation of the file system, felt
uneasy about clicking on a menu item that said little about what exactly
it would do. When I still clicked on it, it just mentioned that it would
change the FAT, but it still didn't tell me exactly what it was going to
do, so I pressed cancel at once. Like, I guess 'move' means 'move file so
that it gets less fragmented', but it didn't say. And in any case, manual
defragmentation is not exactly my favourite.
So, to be fair about it, it might come in handy if you have a special
interest in manually altering your harddisk, but to me, the only value it
has on my harddisk is the fact that it is a harddisk utility, which is
what I'm currently into. It is, however, not one that I'll be using.

Substitute Hebrew by Japanese or Swahili, and you might have a point :-).
On the other hand, I haven't yet seen any program docs written in one of
those languages, but there are a lot of (good) programs for the Atari in
German.

The german atari market is large enough to justify german-only versions,
and you shouldn't assume that everyone is capable of writing docs in
english (there is a difference between `being able to write' and `being
able to read' a certain language). I prefer reading docs, well written in
the programmer's native language, over reading poorly written english.

> I am from holland, but
> all my program/docs/manuals are written in english, I never make a version

The dutch market for atari programs is very small, and there ain't many
people besides the Dutch and some Belgians that understand the language.

Wether the majority of us can or can't understand german (i can't but i know an 'abbruch' from a 'loschen' [g]) I don't think this kind of subtle slagging down of the Germans because they don't write software in a non-native language is either required or helpful.

>> So come on you Germans you have some great software, but its no good if its

Or alternatively, do something even more positive - like proving to German programmers that their products are *worth* supporting in English (for example) through shareware registrations. This is the reasoning behind the CIX supported shareware registration scheme that I (GEMVIEW) and Joe Connor (EVEREST, KANDINSKY & SELECTRIC) have been running for some months now - in fact, without this scheme it's unlikely that any of the programs Joe has under his wing would have been in English at all.

IMHO, the best alternative at the moment is Calamus 1.09n - it's slightly
dated but if you just want mono DTP work then it's still more than usable.
The big plus is that it costs very little - i believe that System
Solutions are selling it for 70 quid or thereabouts in the UK - and if you
check out the classifieds in ST Applications you can often find it
second-hand for a LOT less.

> I've currently got a 1040 STe with an AdSpeed STe, and was
> thinking of buying a used Mega STe. Is there a way to
> manually switch the Mega to 8 MHz like the AdSpeed?

The MegaSTE boots in 8mHz mode by default. To up it to 16 mHz (with or without cache) there is the xcontrol .cpx module, and numerous small auto folder programs. For booting games in 16 mHz mode, there is a program called "booter" on atari.archive.umich.edu in ./Ste/Mega/booter.lzh.

> How
> compatible is it compared to the AdSpeed (I lost very few
> games when I upgraded to the AdSpeed)?

I just got my MegaSTE, and find that about 10% of my games don't work anymore (and a bunch of demos, primarily those that use the Atomik packer). However, I still have my Mega2ST for just this reason :-). I think this has nothing to do with the 16mHz processor (see above), I think it has to do with TOS 2.06 and/or the slight hardware differences between STE and MegaSTE.

> Will I lose any due
> to the high density floppy drive?

My understanding is that the answer is "yes". My MegaSTE has a 720k floppy, so this is not a problem for me.

> The reason I want a Mega
> is for the expansion slot (I need more screen space).

That sounds like a good reason to get one, but I wouldn't toss the 1040STE if I were you. Remember, two computers is the best (dual process) multitasking you can have :-). Also, all those nifty null-modem/MIDI games will be playable right in your own home (much better for real-time mocking, IMHO). You can move the 1040STE out to the big TV in the living room . . .

My MegaSTE is GREAT! I should have gotten one a long time ago, and am rapidly developing TT/Falcon fever.....

Feel free to email any specific questions. I have been collecting MegaSTE information for a couple of months, and will soon stick it all together and put it up on atari.archive.umich.edu. Also, I have refiled some things in the ./Ste/Mega directory that should have been there before.

4478. Molbio software upload

Newsgroup: comp.sys.atari.st
Date: 1994-03-07 20:20:34 UTC
From: krasel@alf.biochem.mpg.de
Message-ID: <2lg2ailNNodd@sat.ipp-garching.mpg.de>
Source record: 191474

Hi fellow atarians,

I have compiled the following programs some time ago. Since they might be
of some use to researchers in the field of molecular biology I thought I
should make them available to the public. I have uploaded them to
fly.bio.indiana.edu (a well-known server concerning molecular biology
software and databases; directory is /molbio/atarist) and ftp.tu-clausthal.de
(/pub/atari/misc).

CLUSTALV is a program for multiple sequence alignment.
Source code is from ftp.embl-heidelberg.de.

READSEQ converts different sequence formats into each other.
Source code is from ftp.bio.indiana.edu.

The programs are archived as self-extracting ZIP archives.

The programs were not written by me. The source code is included in the
archives. It can also be obtained by anonymous ftp from the hosts mentioned
above. I just added suitable project files for Pure C 1.0 and the binaries
(source code compiled with Pure C 1.0).

Every archive contains in addition to the original documentation a small
file named README.ST which describes in more detail how the source was
compiled.

Feedback, complaints, suggestions etc. via email to the address in the
signature.

The average Atari ST user will find these programs awfully uninteresting,
if not boring. You have been warned :-)

Software for sale:

Star Trek (The Rebel Universe?)
Jet
Wargame Construction Set
Breach 2
Xenon
Sidewinder
F-15 Strike Eagle
Gunship
Empire
Gauntlett

I will take *literally* the best offer for these. Please make offers on these games individually. I will give priority to any offer on all games. I will consider trades as offers with my assessment of the trade determining its value. I will sell all of these games EVEN if the best offer is ludicrously low (I don't use them at all anymore, someone might as well get something out of them even if I only get the price of a coffee). Yes, if $0.10 is the best offer, that's what I'll sell them for. All offers must be in by Friday at 12.00 noon.

Buyer pays shipping (< $10 in N.A.) except in trades, where shipping costs will be considered to cancel.

Hardware:

4 x 1 meg SIMMS
4 x 256K SIMMS

Yes, I know demand for 256K simms is limited, but I'll sell 2.5 megs worth if 4 megs can't be sold together. Trades also considered, etc., but I reserve the right in this instance to reject offers that are not reasonable.

(Respond by e-mail.)

> can't buy PowerPC'' attitude.

Hi Mark!

IBM still owes the mainframes, however, due to its size IBM has the power
to influence any market niche in substantial ways without actually owing it.
Such is the power of a monopoly over smaller companies (and everybody is
still a dwarf when compared to IBM). These days this power is more imagined
than real but just as effective, nevertheless.

Drawing from IBM's past behaviour I would be very weary of its newfound
urge for cooperation. It's more a struggle to survive and there's nothing
wrong with that. However, what worries me is what happens when the giant
gets back on its feet? My money is on the stomping to resume all over again.
And so...

> I work in development and I don't know what new developments we have
> locked up in a vault. Can you give me some examples? I don't want exact
> product descriptions, just general information.

I was not refering to any particular product but the list of companies
bough up by IBM is in the public domain. (A search through a couple of
years of the news section of the BYTE will reveal a few. IBM even had/has
a finger in NeXT Step.) In the past, whenever a potential threat (imagined
or otherwise) was perceived IBM's action was to effectivelly absorb and
disolve. Furthermore, when a threat to its monopoly position is perceived
new products were introduced with lightning speed. (These don't just
materialise out of thin air.) Not to mention the work in the IBM-Fellow
program. Thus the conclusion that IBM was capable of more than what it was
delivering. Not to mention intentional crippling of potentially positive
developments (examples too numerous to mention - pretty much everything,
actually - how about the innane attempt to spoil MicroChannel by trying to

keep it proprietory?)

> My intent is not to anger you. I am honestly trying make a positive
> difference for my business. I take the comments that I see in the UseNET
> and show them to management and to the directors of different projects.
> They do listen. Unfortunately, sometimes the suggestions that I see from
> the net take major overhauls in organizations and can take years to
> implement.

No anger at all. It's quite clear you do care, and this is *very* comendable.
I fear, however, that your concerns will not go even near Armonk. Your last
sentence is exactly what I was saying only in different words. I doubt that
IBM in its present form is capable of reform (even with new divisions and new
accounting practices - i.e., payments between divisions in *real money* for
services rendered). For the overhaul to be successful it would really
require dismemberment. So we're back to square one: IMO the only way to
"save" IBM is to "destroy" it.

Funilly enough, the Reagan's dismissal of IBM's antitrust suit was
actually the immediate precursor to IBM's current troubles. Were IBM
forced to split up (like Baby Bells) it would have "saved" itself albeit
as a number of smaller, independent units.

> I read this news group because my Atari ST is my favorite home computer
> and this group has lots of excellent ideas.

I happen to have an ST but I also happen to have other platforms
(guess which one I do *not* have :-)) Or as I often like to say:
"I'm not pro-Atari - I'm just anti-IBM!" :-)

But seriously, were it not for the IBM-PC (and Intel/Microsoft on its
coat-tails) I'd even venture a guess we'll all be driving workstations
today. (Sigh.)

Take care.

Source record: 191482

The answer is clear... Get PageStream (since it does PostScript VERY nicely), and if it doesn't do it for you, buy the competitive upgrade to Calamus SL. PageStream new is well under US$200, and the Calamus upgrade is $200-$250 (I forget), while buying Calamus is well over $500. Therefore, buy Page-Stream and even if it doesn't do it for you, you can still get calamus SL and have saved $$$...

>
>*.zoo: assorted files...

Why is it that there are never any updated docs. The only docs I have found are the docs in mntdoc01.zoo and these are old and incomplete. I'd very much appreciate it if anyone could point me to an updated version of these docs, because I find it cumbersome to have to guess from a few borrowed Unix manualpages.

Erlend.

4486. Atari Still Exists? Tell me more!

Newsgroup: comp.sys.atari.st
Date: 1994-03-07 22:05:47 UTC
From: awt001@acad.drake.edu
Message-ID: <1994Mar7.160547.1@acad.drake.edu>
Source record: 191484

Hi:

Um, I am COMPLETELY new to Atari computers and have absolutely no idea that it still even existed. (I owned a vintage 2600 a LOOOONG time ago...) Anyways, I curious as to what exists on the market for an Atari, and am interested to know more about the "Falcon" computer, specifically:

1. What is it?
2. Why do people want one (ie: What is it mainly used for? Games, etc..?)
3. Why is it compared to the A1200 all the time?
4. What does it look like?
5. What kind of a processor does it run?
6. Related to this, can it be accelerated?
7. What peripherals exists for it? (Can it be conencted to a regular VGA/SVGA monitor and such?)
8. Where the heck does anyone get ANY software of any kind? (ie: Non PD/share ware stuff, that is...) Does a commercial market even exist?
9. Is the OS capatible with anything out there?

Personally, I'm VERY surprised that the number of users in relation to the costs of running a corporation haven't sunk Atari yet, and here in the U.S. there is literally no promotion whatsoever with that Jaguar CD thing.

In any case, any help/comments/advice would be greatly appreciated. As I said I had no clue Atari was still around so I hope I haven't offended anyone -- I'm just trying to find out more stuff. (BTW, does a FAQ exist for Atari systems?)

Thanks!

-Al.

Yes! Why don't you try 7up from Michael Thï¿½nitz. The ATARI-magazine ST-Computer called it the best shareware-text-editor you can get.
You can get the newest version 2.2 (from last week) at the @BI (+49 521 24222) at board 092.

Bye
Olaf

Overscan in Berlin has developed such a 040 board for the Falcon. It should
be available soon. It has a real 040 CPU which runs with 33 MHz. They will
present it at the FEZ-a-Bit, a small ATARI exhibition in Berlin early in May.

4503. VOX-Mail recording problems?

Newsgroup: comp.sys.atari.st
Date: 1994-03-08 01:11:52 UTC
From: Jinlung Fung <jf4y+@andrew.cmu.edu>
Message-ID: <chSx3Mu00WB_RhvuYZ@andrew.cmu.edu>
Source record: 191502

Hello to all those folks trying out VOX-Mail,

I received a call today from a user unable to record in the evaluation version of VOX-Mail. This is not a bug. The reason is that the hardware interface has a high output level and the recording gain was set to a very low value on the Falcon for the answering machine recording mode.

Hence, if you try to use a low-power input device like a low powered mic, the recording function might not be able to pick up the signals. To circumvent this, go to the control panels and increase the recording gain. In the record sample function, the input gain is adjusted by the VOX-Mail program so it should not have similar problems.

Enjoy!

Ta Ta For Now,
Michael Fung

How does someone like me, way out here in the U.S., manage to purchase the commercial version? I'm not even worried about an "english" version, as the program is rather straightforward (except for perhaps, the warning messages). This is one of those programs that does things right for the most part (i.e. unlike the Warp9 background pics (I have Warp9 as well) which are limited to pictures with specific resolutions, Deskpic at least allows any size pictures (in GIF and IMG anyways)...

(the thing I like about varying-size pictures is that if I ever get a monitor that supports my AlberTT card, I could have a nice big 1024x768x16 background pic :-)

>Also, what's the word on the updated version of Geneva? I heard it'll
>work with MiNT and/or PowerDos... Anyone have any news? And what's
>the deal with NeoDesk 4?

The basic gist I got was that Geneva probably won't be updated
until after Neodesk 4 comes out (hey, the guy can only do so much
at a time :-) As of "patch 003" (Geneva 1.02 I think) it still doesn't
work properly with MiNT (you can load them together, but if a program
is looking for a RSC file, for instance, it won't find it like it should).
So no go on the MiNT-compatibility as of yet (I keep hinting hinting
about this on GEnie's conferences, so who knows? :-)

At least you don't *need* to have Neodesk to use Geneva. I did buy
the combo-pack, but find I never use Neodesk anyways (most stuff I can
do without a desktop anyways). Not that it's not a good program,
but Neodesk never really got me hooked...

>
>If it does, and it is on a board somewhere, how would I go about getting it?
>
>Secondly, I would like to set up a SMALL BBs (520ST with Single Sided Drive) for use in my local area (Kanata Canada). Again, is there a half decent PD or SW BBS I could use?

If you want full ANSI on your ST/STe then the only way to truly go is TWO WORLD SOFTWAREs ANSITerm, a really nice little term program (shareware). I use it all the time and I have a FreezeDried, STorm, TeddyTerm etc. on disk but never use em now... :)

Your local (?) ST board should have a copy of the latest version (1.9) or you could get it from most any other ST supporting board.

As for a bbs that'll run on a 520 S/S - whew, thats a stretch, maybe one of the older bbs software MIGHT be able to do it (Nitelite or Vulcan Embassy) - but it is barely worthwhile... I seem to remember an shareware Term from the US that could function as a simple bbs, I got it from System ST (uk) but dont have it any longer - hopefully someone can remember the name....?!?!?

Hope it helps... Andy

>going on??

Yes, I had the same trouble. Examining the header of the output file reveals that the utility is generating DOS-style end-of-lines (CR-LF), but the input scanner apparently cannot deal with them. Very annoying.

Conceivably one could filter the output file before processing it again, but my solution was to get the sources and recompile them myself, although I haven't actually gotten around to compiling them yet...

Have you been watching french, italian, spanish, japanese etc. television
lately? Same story over there, they all ignore your international language.

Anyway, to get back to where it all started: IMO it is ridiculous to
demand special language versions of PD-software. If you really need it,
and you don't understand the original, hire someone to translate it. If
one is not willing to pay the price, one shouldn't complain either.

I have that one Thanks...

The best one that I have seen is GEMfont 122, its the best that I have seen..

I have seen some Funny thing with Fonts, Flash 1.6 has a ANSI option and works good with VT100, but if I install NVDI it stuffs this font up, but if I have a look at the NVDI Fonts they are similar to built in system fonts..??

I know I can disable the NVDI system fonts but I am still puzzled why this is happening..

Can any one shed some light on this...

Please do. Post a pointer here when you release it. I promise I'll
register if it runs under MagiX on a TT.

> The Falcon hardware was designed (in part) in Israel. Now how about if the
> hardware docs were all in Hebrew?

Not a good analogy. People pay real money for the tech specs, and there's
no alternative. The gemfont program is for free, and if I don't like it,
I can look around the net for a better solution, write my own, or hire
someone else to write it (in order of preference ;-)).

PPS

I've also got an Apple Macintosh, since that's another 68000
machine, maybe that can be of any help ???

4526. MegaSTE for sale!

Newsgroup: comp.sys.atari.st
Date: 1994-03-08 06:24:04 UTC
From: aspect@cats.ucsc.edu
Message-ID: <2lh5m4$6v5@darkstar.UCSC.EDU>
Source record: 191528

Well, with people waxing poetic about the virtues of the MegaSTE, I
guess it's time to post my forsale ad.

MEGA STE with Crazy Dots 15 card.

I won't post the specs for the MegaSTE, but here are the specifics for mine.

4 Megs Ram
Hard Drive Host Adaptor (No drive, but plug in any SCSI and it will work)
1.44 Meg Floppy Drive
TOS 2.06

Crazy Dots 15 VME Video Card
32,000 colors at up to 800 x 600
256 colors (24 buit palette) at 1200 x 800
16 colors & less at up to 1600 x 1200

(for $25 can be upgraded to a Crazy Dots II card, which is 24 bit ready,
just needs an upgrade to the driver software not available yet)

NVDI/ET4000 screen acceleration software - Specifically for the Crazy Dots
card, this speeds up screen redraws dramatically.

I'm asking $1000 shipping included for the set, and I'd rather not sell it
individually. Price is negotiable.

For Sale!

Processor Direct is going to press with its first issue shortly. It
is an All Atari mag. (not just Falcon)

The Most recent Address & Phone I have is:

Two Worlds Publishing
3837 Northdale Blvd. #225
Tampa FL 33624
(813) 969-1632

And they can also be reached at P-DIRECT@GENIE.GEIS.COM which will get
you Sean Dougherty, the publisher.

4529. Falcon External Drive Problems.

Newsgroup: comp.sys.atari.st
Date: 1994-03-08 07:42:42 UTC
From: dbrewood@cix.compulink.co.uk
Message-ID: <CMC5F7.5t2@cix.compulink.co.uk>
Source record: 191532

Has anyone had any problems in linking a TOS 4.02 14Mb memory, 65mb internal IDE, falcon to an external SCSI drive?

I'm asking as I've just purchased one from System Solutions, 170mb, and I'm having big problems. I've tried using both the Atari hard disk drivers and the ICD Pro 6.4.2 utils without any success.

Symptoms include data just vanishing in and becoming lost clusters, and file names getting corrupted on copying.

Converting GIF files to JPG format is impossible as they commonly get corrupted, approximately 1 in 6 files. Files which have sucessfully been converted fail to load later as tehy have corrupted.

The internal IDE drive works flawlessly and has given no problems at all.

I'm using the following AUTO programs; Bootkill, Rsetmem, X-Boot, Flop_fix, Jar100, Foldrfix100, Romspeed, Winx, Environ, Fpatch2, Bmapfix2, Snd2Ste, NVDI, NVDI-Fix, Slecrtic, Dmirror, Silkmouse, SHBuf, SAM, LetEmFly, JpegD, AM, blowboot, and LEDPanel.

ACC's: BlowAcc, FalconSX, Harlegp, Jpeg, SAMCNFIG, Xcontrol.

CPX's: COLORVDI, CONFIG, FSOUND, HD_FREE, JPEGCONV, LET_CONF, MULTITOS, NVDICONF, SLCTCONF, SMCWCOLOURS, and WINX.

I'm trying to work out whether the drive is deficient (has been retested by System Solutions and then back to me, supposedly perfect), or whether some software I'm running is causing the problem, or whether there is a bug in TOS 4.02, or finally that the Falcon is broken somehow.

One clue is that formatting the drive with AHDI works perfectly, but if formatting with ICD Pro it comes up with a lot of bad sectors (1 in 15 approx), and then after about 20 minutes the ICD software reports that it is timing out on sector $FF, or $FFF, or something similar, and then says I should try reformatting the drive, which is of course no use at all!

I would be interested in contacting any other Falcon owners who have had similar problems, and hopefully know how to fix them, or anyone who knows of any good hard disk test program that can be tried.

Well I admit that I try to understand some where possible, e.g. I
figured out an earlier version of UPoint where everything was in german.
The problem comes with some of the more technical software. Gemfont is
one example where I found it fairly heavy going to figure out. Another
one which is really difficult to understand is Chaos Studio the Fractal
program. All the mathematical and scientific terms are really tricky to
work out.

Marco Boldt <mboldt@kn.pacbell.com> writes:

>What are the planned changes that will be in version 2.30?
>

Aaron hadn't finalized his plans the last time I spoke with him about FzDT. But, he was going to eliminate some features that either didn't work out the way he'd intended, or had become undesirable. (His script language and the IGS compatibility, specifically.) He was going to try to add internal ZModem protocol if he had time, and VT-x00 emulations. Whether he gets those added depends on how much time he has to work on it.

And, finally, he was considering changing the key format, so old keys wouldn't work with v2.30 or future versions (if he does any). If that happens, the doc file will explain what existing users' options will be. FzDT v2.30 will still be shareware, and freely distributable in the usual ways.

It depends on what you do with it really. Calamus can be got for 89GBP or so if you send in mast disks of your existing DTP package, Timeworks 2 is nice but doesn't add all that much more over 1 but can be got very cheaply through various routes ie about 40GBP.

In article <1994Mar7.160547.1@acad.drake.edu>, awt001@acad.drake.edu writes:
|> 1. What is it?
A 16Mhz 68030 computer with a 56001 Digital Signal Processor, built in sampling. Can sample direct to HD. Multitasking (pre-emptive) OS, fully programmable graphics modes with upto 65000 colors on screen and high res (I have been upto 1400x1000).

|> 2. Why do people want one (ie: What is it mainly used for? Games, etc..?)
I use mine for the same as I used my ST for but with more color, speed etc. Basically, I use it for DTP, WP, database, spreadsheets, music, sampling, programming, graphics and the odd game.

|> 3. Why is it compared to the A1200 all the time?
They're similar in basic spec but the 1200 is a lot cheaper. On the other hand, the Falcon has a lot mor ebuilt in stuff like the DSP, SCSI 2, 16bit audio and a lot more. The arguments are do you want a basic machine you can add to ie 1200 or do you get a fully integrated system with potentially bits you don't want/need ie falcon.

|> 4. What does it look like?
Exactly the same as An Atari ST ie similar to an Amiga 1200/500 wedge.

|> 5. What kind of a processor does it run?
16Mhz 68030 with cache. You can add a co-pro and a 32Mhz 68030 with Fast RAM. A 68040 is due RSN and you can also add a PC processor into a slot inside. This enable you to run Windows in color under emulation.

|> 6. Related to this, can it be accelerated?
See above.

|> 7. What peripherals exists for it? (Can it be conencted to a regular VGA/SVGA
|> monitor and such?)
Uses TV, RGB, VGA, SVGA or multisyncs. Standard types with standard connectors. SCSI 1/2 with standard connectors, Internal IDE slot for HD. Standard MIDI, RS232 and centronics connectors.

|> 8. Where the heck does anyone get ANY software of any kind? (ie: Non PD/share
|> ware stuff, that is...) Does a commercial market even exist?
Yes it does! I have load s of real commercial software for it. Up until about 1990, the ST, the Falcons forerunner, was almost outselling PCs in Germany. Most really good Atari software comes from there. There is photo retouching software that is as good as the Mac, Superbase Pro, loads of MIDI - the Atari line aree the premier MIDI computers and used in pretty much every studio. I can't list what else there is as there is so much of it. Ataris mainly sold in Europe though so that's where the action is. In the US they are hardly heard of.
I'm about to buy a video digitiser and update my HD backup software. There are

lots of firms producing lots of great hardware and software for the ST and Falcon.

|> 9. Is the OS capatible with anything out there?
Well, it uses the MSDOS disk format and internally looks very like Unix but really, no. Like the AMiga, Mac, PC it has it's own proprietry OS called MultiTOS. I like it myself :-)

|> Personally, I'm VERY surprised that the number of users in relation to the
|> costs of running a corporation haven't sunk Atari yet, and here in the U.S.
|> there is literally no promotion whatsoever with that Jaguar CD thing.
I heard the Jag was being very heavily advertised. The Jag newspaper add won an award at the CES for best ad!

As I said, the US is dead for Atari computers. In Europe, they sold millions. You would even see them in the background being used on news programs. There was a very healthy Atari DTP market in Germany with chains of Atari specialist DTP bureaus. I have 465Mb of HD and it's full of software both comercial & PD.

|> In any case, any help/comments/advice would be greatly appreciated. As I said
|> I had no clue Atari was still around so I hope I haven't offended anyone -- I'm
|> just trying to find out more stuff. (BTW, does a FAQ exist for Atari systems?)
There is a monthly series of FAQs posted here. Wait a while and they'll appear again.

> know more about the "Falcon" computer, specifically:
>
> 1. What is it?

The last computer by Atari. It's a ST, with lotsa improvements, for
example:
1) a 68030 at 16 Mhz, on a 16bits bus.
2) a BLiTTER at 16 Mhz too.
3) Fully programmable and very flexible video processor (VIDEL), which allows
fantastic video modes: from 640x200x2c to 1664x608ix16c (i for interleaved,
c for colors), with >800x600ix65536c, 256c modes with a palette of 256K colors,
etc....
4) Hardware scrolling and overscan (once again, fully programmable)
5) Sound : 8 voices, stereo, 50 KHz-16bits, DMA.
6) 2 jacks for sound input/output : you can record whatever you want in
direct-to-disk with very little efforts: some PD programs do it perfectly.
7) Internal IDE hard-disk (optionnal, but the IDE port is there however)
8) Ports: SCSI-2, serial port (RS232 or more, I don't remember), parallel
port, MIDI in/out/thru, DSP port, 2 mouse/joystick port, 2 paddle/light-guns/
etc ports, jacks for sound input/output, video output (U can plug either a
TV, an RGB monitor, or a VGA/SVGA/multisync monitor), another video output that
can be send data directly to your video-tape recorder, if I'm not wrong !!!
9) A DSP: a wonderful but still not very, very used processor: in theory, it
can do intensive maths calculations, sound transformations, modem, etc... What
you can get actually which uses the DSP is however a bit limited: some sound-
tracker replay routines, fractals programs, some demos... But still a huge
potential
10) Quite good compatibility with ST softwares, in fact, well written ones:
good GEM applications, games without too stupid protections, etc...

> 2. Why do people want one (ie: What is it mainly used for? Games, etc..?)

Because it's a very good machine. Let's compare it with a PC : for
the same price, you can get:
a Falcon: a wonderful machine, very pleasant to use, enormous potential, but
very few specific software.
a PC: a shitty machine, unpleaseant to use, but really more powerful than a
Falcon, and with a lot of software. However, it's power tends to disappear when
you use Windows.... :-)

The Falcon is mainly used for coding, enjoying computers, etc... But in
a near future, it should also be used for playing and morphing...

> 3. Why is it compared to the A1200 all the time?

Because the ST and the Amiga were always compared (which was quite
stupid). It's at least as stupid to compare them than to compare the ST and
the Amiga: they are absolutely not at the same price, one has got a DSP, the
other doesn't, etc...

> 4. What does it look like?

It's exactly like a ST: it is in an ST box, the only difference is the
color which is a little bit darker, with a dark grey keyboard, and a colorful
ATARI logo.

> 5. What kind of a processor does it run?

a 68030, and it features a math coprocessor support. You buy it, you
plug it.

> 6. Related to this, can it be accelerated?

Yes, you can buy accelerator cards, with 68040.

> 7. What peripherals exists for it? (Can it be connected to a regular VGA/SVGA
> monitor and such?)

You can plug almost everything on it, since it includes SCSI-2 port.
Now, you need appropriates drivers... But CD-ROMS, printers, scanners, etc...,
everything is accepted. Monitors, see above. You can also buy little external
hardware extensions, which push the video beyond its normal limits: you can
get 1024x768x256 colors on a good monitor..., or 1280x960x2 (4?) colors...

> 8. Where the heck does anyone get ANY software of any kind? (ie: Non PD/share
> ware stuff, that is...) Does a commercial market even exist?

Hem...In France, you can get some..

> 9. Is the OS capatible with anything out there?

With the ST, yes

>
> Personally, I'm VERY surprised that the number of users in relation to the

No promotion anywhere. However, Atari is mainly a make which survives
because of its machines, which please to some people so much that they wouldn't
change for anything. However, these people are not the majority, and if Atari
doesn't do some promotion, it will sink...

4544. TOS needed

Newsgroup: comp.sys.atari.st
Date: 1994-03-08 10:58:53 UTC
From: donq@cip.e-technik.uni-erlangen.de
Message-ID: <2lhlpdEgs3@uni-erlangen.de>
Source record: 191549

hello, all,
i need a TOS in ROM, and it should be a version, not older than 1.4, likely
2.0 or so...
if there`s anybody interested in selling his old one, please mail me
my address:
donq@cip.e-technik.uni-erlangen.de
thanks

[FIGURES DELETED]

This is all true, of course, except for the very important fact that
although a lot of German's do understand English (at least, a lot better
than the average Englishman understands German) they may not be able to
write it. As someone said in here, reading a language and writing a
language are two different things.

Which is why I can't blame a German programmer for not releasing his
product in English.

Hello,

I would be interested in including POSTSCRIPT-pictures to Latex.
From UNIX, I know that there is an epsf-style, who knows more
on that topic with regard to the ATARI ?

Besides that, is there a dvips program available for the ST on any
FTP-site?

Greetings, Dirk

I like both the color monitor and the Monochrome. But Color isn't just for games. And if you use the computer just for games a TV still wont look as good as a monitor. Not even a big screen S-video TV. There is just something about the Atari Monitors. They are very crisp and clear. Also there are some great programs that only run in color. Just like there are some great programs that run only in Mono. Look at Photo-Chrome 3, and Octalyser STe. Both of them will not work in Mono. And on a TV they look bad.

BTW have you ever checked out AnsiTerm 1.90. If so how do you like it. I know you hate color programs. But I know the programer personally. And I'm one of the beta-testers. He has a newer 1.91 which has some extra features. Also is there any chance that Atari ST Review or any other UK-Mags would put AnsiTerm 1.90 on the cover disk. The reason is simple as AnsiTerm is the only 16 color Ansi term program for all ST's it even works on the Falcon/030 in the Low-res Compat. mode, A friend of mine uses both Ansi-Term and Connect on his Falcon. It seems that Ansi term will have some stuff that non of the other term programs will have. Underline, Blinking and other neat effects.

Actually I have Connect, Teddy-Term, Stalker 3.02, FZDT, Interlink and some others but I always go back to AnsiTerm. It also works good on HS-modems.

Clifton Mothershed

Also Ansi-Term isn't that big in size. In both PRG and LZH form. And it is very easy to use and to the point.

Clifton Mothershed!

SW> I hope he's got good glasses....

Actually 9pt. Text is the normal text for Med. Res, 8pt Text is the smallest you can get and you do need glasses to see it. But 10pt text is too big for me. Actually I use AnsiTerm and I have come accustomed to the small text. But 8pt is even smaller then Ansiterms text.

9pt is Standard on ALL ST-Med resolutions.

Well it looks to me, like Alwin Stumpf is a "jumpy" guy!

He jumped ship, when the Tramiels abandoned Commodore and he left ATARI under obscure circumstances. But his jump back to Commodore wasn't all that direct. If I recall correctly, he started on another company. Either they fired him, he "left" again, or Commodore needs someone to start a new series of PC compatible computers ;-)

Well, its _Single_ Image Random Dot Stereograms in fact - as opposed
to common or garden stereograms that use one image for each eye and
converging lenses or the ability to squint strangely.

If you're interested in these, there's a FAQ on them that appears in
alt.3d every once in a while. This lists sites for gifs and code -
perhaps somebody could compile some c-sources for the ST ? Trying to
view these in something like Photochrome is nearly impossible though,
I'd recommend a higher res than ST colour.

regards,

Sam

Net-Sale Gone Bad
I need Legal Help in Berkeley???

I need some help from someone who knows the small claims court system in Berkeley, CA or US Mail fraud law. A Net-sale deal went sour on me. I sent $2000 worth of Atari computers, laserprinter, harddrives, software,etc. via UPS (C. O. D.) to an individual named Emerson Mei, at 2528 Regent Street, Berkeley CA, in December. If anybody wants to verify the facts, call him at 510-549-0532.

He received the shipment, paid $625 and immediately placed a "STOP PAYMENT" on the second large personal check, without telling me. I found out in January when I tried to cash his check! He says I misrepresented one item (out of 16 items) - one computer had only 2 MB RAM, not 4 MB as he thought - and is using the money he owes me to upgrade it!!! I did tell him it had 2 Mb on the phone and described all of the items in detail, in a letter sent before he received the stuff, so he is simply screwing me. In three months he has not returned anything for a refund (I gave him 30 day return on anything not working!) and has not paid me. I have sent numerous letters and made dozens of phone calls to him attempting to resolve this situation. Yesterday (3/7/94) he said he does not even have all of my equipment anymore, to send back. Like he sold it, WHOA !!!!! He apparently wants me to sue him.

I want to nail this con artist for big bucks.

Please give me specific info on the California or US law on this situation, or tell me someone to contact who might know.

I am in Hillsborough, NC.-- Not exactly convenient for a court case in Berkeley. If this is akin to mail fraud maybe I can get a judgement against him in Federal court.

Or is this claim too small potatoes? to worry about.

HELP!

Don Nelson, 5024 Orange Grove Road, Hillsborough, NC 27278

March 8, 1994.

Please be on the lookout for my Atari equipment.

I "sold" it to Mr. Emerson Mei in Berkely, CA in December and he has not
paid me for it.

He may be trying to sell or trade it - an illegal act - since I am sueing
him for recovery at the moment.

The list of equipment and serial nos. are as follows.
==========

Atari Hardware FOR SALE Nov. 27, 1993.

Itemized list with serial numbers.

Atari MegaST2 with keyboard , A17B1008401, A1941001052MB
Atari MegaST2 (+2=4MB), +ADSpeed 16MHz, A17B1006409, A1921012013
Supra HardDrive, 85Mb, ext. disk and Manual, 120787077
Custom HD 2 bay under monitor case, power
supply IDC controller, 65Mb drive doesn't work,
Atari SLM804 Laser Printer, disks + manual,W1815007113, V17C1000642
extra drum and toner cart

Golden Image Mouse GI 250

SpectreGCR Macintosh Emulator with 128KROMS, # 0190312, disk S 12708
and another, " # 04917902, disk T14032
Atari floppy drive, SF314 d/d

Atari Mono Monitor, SM124, N1561003381

==========

If anyone sees this equipment offered or has already bought it, please
contact me immediately. IT IS HOT, not stolen, but definitely not paid for.

Personally, I learned Spanish. I can see it being quite useful,
but had I realized that so much good stuff came out of Germany, perhaps
I would've went for that instead. Sometimes ya can never
win...

Besides, ya know how long it takes to translate a program, even
just some text in a RSC file, when all ya have is a little pocket
German2English dictionary? ;-)

I ran an STFM for about 6 years on a mono-monitor as most of what I do
does not require colour (I mostly run a C compiler, DTP, or TeX).
Besides which I found it impossible to read any text in med-res
(although I suppose a decent monitor would have helped).

Currently, though I am using a Falcon with something called a
ultra-VGA monitor attached (what is that supposed to mean?) at
800x600. The colour is nice to have as a novelty, but I still
don't really require colour for most of what I do.

[Don Nelson writes about getting screwed in a deal for $2000 worth of Atari computers by Emerson Mei, of Berkeley, CA...]

I didn't know there were still $2000 worth of Atari computers in existence!

Sorry to hear about your sour deal, though. Why not report this incident to the Postmasters in both NC and Berkeley. Also, if you know any lawyers, just have them write a good letter to Mr. Mei, asking for his prompt payment, or return of any equipment not paid for in full. Lawyers are good for that sort of thing, and it might demonstrate you are serious about getting you money back.

I just bought Warp 9 3.81 and it has provision to change the system
font. It includes tons 'o fonts. The only problem I have is that
it does not have a way to edit the fonts and they don't seem to be
GDOS compatible format (or even GEM compatible), ie. none of the
font editors I've tried work on them. Most of the fonts do not
have decent characters for special things like window gadgets
and checkmarks. Does anyone know of an font editor to change
these things?

Thanks,
Sam

Probably 'cuz the mntdoc files are for the low-level Mint calls, not the actual Mint library!

The Mint library is more-or-less a Posix library, so if you do understand the Posix/Unix calls, you're Ok. But yes, some sort of documentation would be great. I was thinking of doing something in 1st Guide (hypertext).

I am truly sorry you got screwed, I really am.

IANAL (nor would I want to be) but since you didn't send via USMAIL, Mail fraud laws don't apply. That's what many of the current scams involve lines like "We'll send a courier to pick it up" or "FEDEX us your money". Mail fraud laws are tough but only if you use the mail.

That's two of us that are interested in such a program,. I've been searching for a decent copy for a long long time, with no luck so far. I have seen custom routines on a friends BBS though that will make your eyes water, it has characters popping up from time to time and you can have long conversations with them. The author of the programs will not release the source code though.. a pity.

Whenever I try to use the Atari standard clipboard with either Everest or MasterBrowse, they will always complain about "clipboard not installed" although I do have a \CLIPBRD folder in my boot partion and the environment variable CLIPBOARD points to the same path and this works perfectly with all other programs that support the clipboard. Is this a bug in these two programs or am I doing something wrong here? The problem seems to go away if I install MultiTOS, but I seldom use it so that's not a very good option.

System used: Falcon + 4meg + internal HD + TOS 4.01

That has been debated for a long time now, but the fact is that code executes faster if you use move.l instead of move.w instructions .. the Falcons bus seems to use 16 datalines, but either multiplexed or dealt with in some way to speed up processing.

(My texturemapping routs became faster when doing move.l instead of move.w ..)

I know for a fact that in a few of these countries that you say
ignore the 'international languages, they indeed have radio stations
and TV stations dedicated to English. No, in daily life in these
countries, it might not be English, but it is flying all around. I am
not saying this to say that programs must be written in english, as you
can give me a program in french(not too many I know) and I will not
have a problem(Go Le Redacteur!!!!). Look around the world before you
say that english is not where you say it is. It seems to invade even
the most unlikely places...

I'm still not happy with this emphasis - although I agree wholeheartedly with the sentiments of registering software I understand. I think this debate would go a little more smoothly if a) the international language thing was dropped, and we all recognised that most countries have their own languages and that people living there are more likely to speak them than English and b) that there was some recognition that shareware authors are usually operating on a amateur basis (marketing and distribution wise) and may not have the necessary knowledge, contacts or will to write multi-language versions of their software.

This isn't a go at you, Daron - it's more a message responding to all the previous messages on this subject.

>Hi:

>know more about the "Falcon" computer, specifically:

>1. What is it?

Atari pegs it as a multi-media machine.

>2. Why do people want one (ie: What is it mainly used for? Games, etc..?)

Lots of atari owners are music makers. :)
Cubase Audio, MIDI sequencing etc.

The falcon also has pretty good graphics modes and a 56001 (A DSP)

>3. Why is it compared to the A1200 all the time?

Commodore and the amiga is kinda the 'arch-enemy' of the Atari and
ST world. the A1200 was released at a similar time, and is priced in
about the same range.

>4. What does it look like?

Like an ST, but with darker keys.

>5. What kind of a processor does it run?

Two of em. 16Mhz 68030, 32mhz 56001

>6. Related to this, can it be accelerated?

Yup, 32 mhz 030 boards and an almost ready 040 board.

>7. What peripherals exists for it? (Can it be conencted to a regular VGA/SVGA
> monitor and such?)

Yep, Composite, VGA, TV, RGB, the whole shabang.

>8. Where the heck does anyone get ANY software of any kind? (ie: Non PD/share
> ware stuff, that is...) Does a commercial market even exist?

I drive down to a Atari store and buy stuff. But thats the bay
area for you.

>9. Is the OS capatible with anything out there?

OS'es are inherently incompatible with 'other' ones.
The falcon reads and writes IBM format 3.5" disks however.

>Personally, I'm VERY surprised that the number of users in relation to the
>costs of running a corporation haven't sunk Atari yet, and here in the U.S.
>there is literally no promotion whatsoever with that Jaguar CD thing.

Take a look in a gaming magazine, you'll see jaguar ads.
BTW, "that Jaguar CD thing", doesn't have a CD (yet).

The jaguar is primarily a cartridge game console. If you were 'into'
games, you'd know that it existed, what it does.. etc.

>In any case, any help/comments/advice would be greatly appreciated. As I said
>I had no clue Atari was still around so I hope I haven't offended anyone
>just trying to find out more stuff. (BTW, does a FAQ exist for Atari systems?)

Yes, a FAQ is posted here monthly (?).

>ago...) Anyways, I curious as to what exists on the market for an Atari,
>and am interested to know more about the "Falcon" computer, specifically:
> 1. What is it?

It is a computer in a keyboard casing just like A1200, but it features a 'real' 68030 Processor with MMU and 16 MHz even on board. It also features a DSP processor running at 32 Mhz (rated at 16 MIPS) with 96 KB SRAM. Sound is 16 Bit digital sterosound with over 50 Khz. The Falcon has a VERY flexible graphicprocessor, which allows lots of different resolutions. It features 256 colour graphic as well as 65536 coloured ones. These DC graphic mode needs little processing time, so you can easily write games in 65536 colour mode. This is not possible on A1200 in HAM8. The Falcon has internal 2,5" Harddrive (standard: 85 MB) and 4 MB. It also features an internal 1.44 MB HD-diskdrive, and it also features an audio-in port so you can just plug in your stereo and beginn to sample or doing karaoke with your standard music CD's.

>2. Why do people want one (ie: What is it mainly used for? Games, etc..?)

Because its a good computer especially for musicians, because it features standard MIDI socket, direct to disc recording with realtimeeffects done bei the DSP-Processor. (eg. Cubase Audio). It's also well prepared for genlock und it would be also quite good for games. The FALCON is compatible to the ATARI ST series of computer, so many people step up to the next generation.

>3. Why is it compared to the A1200 all the time?

Because shortly after Atari announced the Falcon, Commodore came up with the A1200. It's comparable but it features only a smaller and slightly slower processor, without DSP, and still 8 Bit sound. At the end the A1200 is nothing else than a Amiga 500 with turbocard, new graphicprocessor and harddrive. There is only one conclusion: the Falcon is better.

>4. What does it look like?

It is a keyboard-computer with grey casing, and dark grey keys. Floppy is on the right, most of the connections on the back. MIDI, catrigeport and the 15-pin extended joystickports are at the left. Standard joystick/mouse port is a the front.

>5. What kind of a processor does it run?

A Motorola MC68030 with 16 Mhz. There is a socket for a optional MC68882 FPU.
A Motorola DSP56001 is used as coprocessor working at 32 Mhz.

>6. Related to this, can it be accelerated?

Shure, there are lot's of different acceleratorboards available (in germany), Relativly cheap accelerators, which speed up the processor, or more expensiv ones also speeing FPU and the systembus and having fastram. There is also a new 68040 accelerator board available.

>7. What peripherals exists for it? (Can it be conencted to a regular
>VGA/SVGA monitor and such?)

The Falcon can be connect with nearly all monitors, VGA/Multiscan/RGB. You only need to buy the right adapter (not that expensive) or build it yourself. It is also possible to conect it to the TV via antenna cable.
There are some periphials available: external SCSI2 hardrives, a videodigitizer card, a PC emulator, some small cards which you plug between Falcon and your monitor to get higher resolutions, and all standard printer and stuff.

>8. Where the heck does anyone get ANY software of any kind? (ie: Non
>PD/share ware stuff, that is...) Does a commercial market even exist?

Yes there is a commercial Market. Cubase Audio a very professional musicprogram was just released. There are some paint or morphingprograms (Chroma Studio) using the Falcons graphicmodes and DSP, some sound/music effect programs,...
Lot's of professionel software written for the privious range of Atari computers ist compatible and often they are resolution indpended and can take advantage of the Falcon graphic modes.
You will get software from registrated Atari dealers.

>9. Is the OS capatible with anything out there?

OS: Atari uses TOS as in their previous computers (ATARI ST(E)/TT series). There is a single task version built in and a multitasking version (MultiTOS) can be loaded as addition. Without the PC/MAC emulator the Falcon isn't compatible to other computers except the Atari ST(E)/TT line. But the Falcon writtes its disk the same way than the PCs so it's no problem to exchange data with PCs.

Most of the Atari sales were done in Europe not in the USA. Atari is busy now selling the Jaguar, but there are rumours that there will be a 32 MHz Falcon with desktop casing this year. But who knows except Jack Tramiel ?!?

I think this is the key point. If German authors feel they'll get more
registrations if they support English versions, then it is in their
interests to do so. It is a three sided coin: German authors may also
feel that English support is not worth it; English authors might feel
that German versions are worth it (I intend to make a multi-lingual
version of my current project).

>is for the expansion slot (I need more screen space).

You can switch between 8mhz, 16mhz (no cache), and 16mhz (cache) as simple as running a small program (see the atari/Ste directory at atari.archive.umich.edu), or just using XControl 1.31 (you can switch the speed in the GENERAL.CPX). There's no *physical* switch to throw.

I dunno about the games. Some things (games with copy protection in particular) may work under 8mhz, etc (since some protection is timing sensitive). But for most things, the MegaSTe is quite nice (and the external keyboard makes it worth it :-) As well as the high density drive...

>fromm what I could make out, I suspect that MiNT compatibility will
>probably only be added in a 'major' upgrade. (v2.x or something)

Actually, the current version of Geneva is 1.02. (Release 003 is what is says in the program. Why Dan made the version and release numbers different, I'll never understand... :) We plan on adding MiNT/PowerDos compatibility in the next version of Geneva. Whether or not that version is going to be available as a patch remains to be seen, proobably mostly dependant on just how big a change there is to the executable file. It probably won't be version 2.x, 1.10 at the most, maybe even 1.03.

I was born in Israel, people there speak Hebrew and are very proud of this rich and poetic language (the bible was originally written in Hebrew). Yet, every Israeli will happily admit that English is the international language. This is very evident when it comes to modern technology. RAM is RAM in Israel and not ZA which is the Hebrew equivalent.

A more important point is that the German programmers are writing superb stuff, but most English and US users are stuck with old, dated programs and a feeling that the Atari software scene is dead. This is a contributing factor to the decline of our beloved platform. If more programs like Connect, Selectric, Everest, and many others were available to English speaking users - things would certainly look on the brighter side.

So the Germans, by insisting on using their own language, are unknowingly contributing to this decline.

a> Um, I am COMPLETELY new to Atari computers and have absolutely no idea
a> that it still even existed. (I owned a vintage 2600 a LOOOONG time
a> ago...) Anyways, I curious as to what exists on the market for an
a> Atari, and am interested to know more about the "Falcon" computer,
a> specifically:
a> 1. What is it?

It's a 32bit computer with either 1, 4 (standard configuration) or 14 megabytes of memory mounted in a plastic case with keyboard on top and an optional 2.5" harddisk fitted inside. It features a fast, efficient and user friendly graphical user interface with optional multitasking capabilities. Display modes range from 320x200 to 640x480 pixels
(depending on monitor type) in 2-256 colors from a palette of 262144 or (using a special 16bit "true color" mode) up to 65536 colors on screen at the same time. 3rd party software and simple low-cost hardware can expand this to 800x600x256, 1024x768x16, 1280x960x2 etc. Sound is very good, up to 8 channels in 16bit/50kHz stereo-hifi quality.

a> 2. Why do people want one (ie: What is it mainly used for?

It is mostly wanted for its professional and semi-professional music and MIDI applications but it is also very strong on graphics. The most common use is probably as a programming platform for hobbyists and hackers and for general computing needs. There's not many games for it I'm afraid.

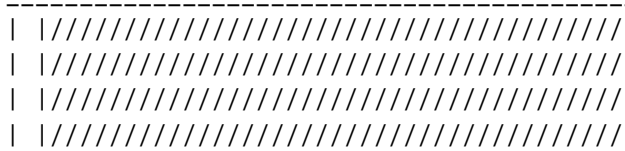
a> 3. Why is it compared to the A1200 all the time?

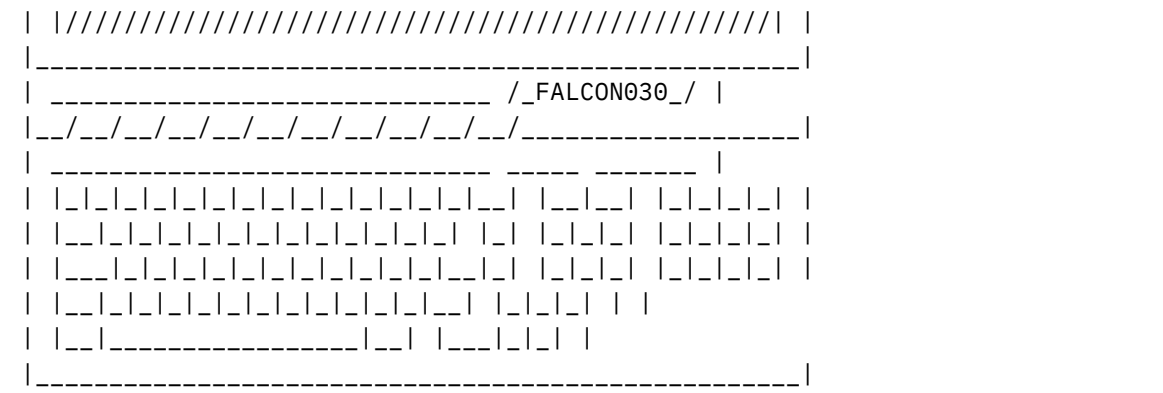
Not sure, but I guess it's part of the old Commodore vs Atari battle that's been raging since the days of the C64 and 800XL. The Falcon is more expensive than the Amiga 1200 but it is also technically superior in all but a few areas.

a> 4. What does it look like?

Is looks like those typical mid-80s cheap looking "all-in-one" home computer consoles. Frankly. it's damn ugly. :-) Luckily, the things hidden inside makes up for its poor appearance.

Here is an ASCII-picture resembling the Falcon:





a> 5. What kind of a processor does it run?

The main processor is a 32bit Motorola 68030 running at 16MHz but sitting on a 16bit wide bus to memory. Therefor I like to think of it as an 030SX. :-) In addition to that, it has a digital signal processor (DSP), a Motorola 56001 running at 32MHz. Its main purpose is to add real time effects in music recording but it is also a very good general co-processor capable of very fast calculations. There are other special custom chips including a 16MHz blitter to speed up graphic operations. There's also an empty socket for a plug-in 68881/2 maths co-processor.

a> 6. Related to this, can it be accelerated?

Yes, there are some 3rd party accelarators available or in development.

a> 7. What peripherals exists for it? (Can it be conencted to a regular
a> VGA/SVGA monitor and such?)

It can use any standard VGA/SVGA monitor, as well as RGB and multisync monitors and even regular TVs. It has also a standard interface for connecting SCSI peripherals including CD-ROMs, harddisks etc.

a> 8. Where the heck does anyone get ANY software of any kind? (ie: Non
a> PD/share ware stuff, that is...) Does a commercial market even exist?

There are some excellent commercial software available, but you have to look long and hard to find it. Mailorder is often the only option and most stuff originates from Europe, mainly from Germany, France and the UK.

a> 9. Is the OS capatible with anything out there?

Well, it is of course compatible with 99% of all TOS software for the Atari ST and TT computers apart from some poorly written stuff and many old games. It is also file compatible with standard MS-DOS disks in both 720KB and 1.44MB HD format. You can even add some limited Unix
compatibility with MiNT/MultiTOS and MinixFS. There are currently a hardware PC-emulator available based on the Intel 80286 running at 16MHz and both 486SX and Macintosh emulators are in development.

a> Personally, I'm VERY surprised that the number of users in relation to
a> the costs of running a corporation haven't sunk Atari yet, and here in
a> the U.S. there is literally no promotion whatsoever with that Jaguar

a> CD thing.

I'm sure you will see great improvements as the national launch of the Jaguar
is gradually progressing throughout the US. We poor Europeans are still waiting
for it to be officially released over here.

a> In any case, any help/comments/advice would be greatly appreciated. As
a> I said I had no clue Atari was still around so I hope I haven't
a> offended anyone -- I'm just trying to find out more stuff. (BTW, does
a> a FAQ exist for Atari systems?)

Yes, there's a FAQ posted here once in a while but I haven't seen it lately.

a> Thanks!

You're welcome!

I believe the ST port of GNU EMACS is complete. If so, try running
doctor.el. Even better, make a macro so yow.el talks to doctor.el (doctor
is an Eliza clone, yow is a weird sentance generator). For the truly
bored, there is an ASCII "Towers of Hanoi" simulation. Hell, it's rumored
that you can even edit text files with the thing :-)

The easiest way to execute a .el file is to use <meta>-x /path/whatever.el.

The only criterion for registration is whether or not one is *using* the
software. If I were using a shareware program without understanding the
docs and online text (some GEM programs are quite straightforward), I
would still pay the shareware fee.

4608. Atari Info Wanted

Newsgroup: comp.sys.atari.st
Date: 1994-03-09 05:04:52 UTC
From: tlrsidp@nmt.edu
Message-ID: <1994Mar9.050452.1882@nmt.edu>
Source record: 191365

Ok, I'm selling my Mac LCIII and will probably buy another Mac, but I'm always curious as to my options. (No flames as to my computer of choice I had an Atari 800 and 1040st in the past....) I'd like to purchase a system w/ an '040 standard (i don't want to have to upgrade to one) and possibly DSP's onboard. (The 660av mac is the system I'm serious looking at) I'm not too critical as to available software, but I'd like to know the status of commerical software in the Atari Market. So, does Atari make any computer that would satisfy what I want. I'd like info on prices, standard configs, video display options (ie vram/accelerator chips).

thanks in advance

tlrsidp@black.nmt.edu
email info or post (i check both regularly)

ps i also would like to know if there was a way for me to connect my HP 550c (AppleTalk Connector) to an Atari.

It was none other than Mike Garrish that wrote on 1 Mar 94 that ,

MG> I am abut to buy an Atari 1040 for a cheap MIDI setup, and before
I
MG> splash out on an SM124 monitor to run Cubase and Avalon, is it
MG> possible to buy emulators which will allow these programs to work
on
MG> a normal TV? I have heard about these products, but I imagine
there
MG> must be some sort of speed/clarity penalty. Any advice would
be
MG> appreciated.

Both work with 'Sebra' (PD mono emulator but the best)on Color Monitor's but are pretty hard work and If you are serious .....and if you are buying Qbase and Avalon YOU are serious !!! then small extra cost for a mono monitor when compared to the outlay for the software is going to be desirable in the long run . Clarity isn't _too_ much of a problem (on a monitor anyway ..on a TV I can imagine some problem's) if you double the screen size but speed is since you have to scroll about the screen AND there is some processor overhead's on top of
that.

CP>
CP> : Greetings ...Patrick.
CP> Hangs on my Falcon also :-/

Is this RDD3.1 ? Install it as a GEM program not as a TTP ,the later causing hanging problem's and a loss of mousey control.

Also the install program doesn't seem to agree with NEWDESK. (At least this was the case with V3) .Install it into the desk manually and it work's OK.

4623. 2.5 Megabytes of SIMMS on the STE

Newsgroup: comp.sys.atari.st
Date: 1994-03-09 10:26:54 UTC
From: ae-a@minster.york.ac.uk
Message-ID: <swordfish.763209769@minster.york.ac.uk>
Source record: 191380

I am about to upgrade my Atari 1040STE to 2.5 Megs
using 2x1meg SIMMS and 2x256k SIMMS.

I know that in order to use the full 2.5 megabytes, I
need a patch utility, but what happens when I have not
used the patch utility? Does the STE think it has
512k, 2megs, or something else. I will not be able to
use the patch on autobooting copy-protected software, and
would like to use 2 megs when the patch is not used.
Does this have something to do with the order in which I
install the SIMMS?

gzip -cd is similar to zcat. Just make a hardlink and use zcat in the
future, if you want to extract gzip'd files to stdout. If your shell
supports ARGV, gzip will see it's called with zcat and knows to add
"-cd".

NOTE: On a real UNIX box zcat may be a link to compress. compress
isn't able to handle gzip'd files, but gzip can handle compressed
files. Just make sure the gzip-zcat (usually in /usr/local/bin) is
found before the compress-zcat (usually in /usr/ucb) in your PATH.

Is your external drive terminated (either with an internal SIP or external block)? If it's not, you'll get exactly the type of data corruption you're reporting. And the ICD software will tell you that you have problems, but AHDI won't.

STformat Issue 26 (sep 91) page 26... [(c) Future Publishing]

XControl is the newest version of the Atari Control Panel Accessory which is designed to take advantages of features available in the latest (above V2.0) versions of TOS.
All STs can use XControl, but if you dont have a Mega STe, TT030, or later machine, you must use the shutdown feature of XControl whenever changing resolutions (See note under Shutdown).

S H U T D O W N

Whenever you change resolution you must shut down the Control Panel. If you don't perform the shut down, unexpected results may occur during other applications. This option only appears if your version of TOS does not support the proper shutdown procedures.

I am fine with German, but whenever I demonstrate my computer running
Gemini to other Dutchpeople, their first reaction is: `whuh, it's in
German'. The stupidity of this sort of encourages me to stick with the
German software.

BTW, it isn't that hard, is it? To try and understand the menu bar of
a German application. I mean, Close window is where it should be, so
everybody knows that the German word for 'close' is ^U.

I'd really like to know what IBM's *monopoly* is in?

I mean, really... the mainframe and mini market is *gone*. They have a monopoly in OS/2, but hey, unlike Microsoft, IBM publishes the complete API; no funny stuff where IBM applications programmers get to use better, undocumented functions to make their software faster/more compatible/whatever than the competitions (unlike Microsoft, IMHO the true villain in the PC marketplace; IBM's fangs were removed as soon as the clone market exploded).

Motorola's got a monopoly on 68k chips as far as I know; they're also a giant, but mostly because they're diversified. Is Intel better than Motorola because there are Intel clones (ie, they don't technically have a monopoly; IMHO, effectively they do, thanks to the FUD they spread about Cyrix, AMD, etc).

Not that I'm suggesting IBM is blameless. Things *are* different now because they *have* to act differently... The market demands it. IBM's also got to do lots of extra things (like _detailed_ lists of what a bugfix actually does; unlike Microsoft's Windows 3.1->3.11 "update", which seems to do just one thing... break OS/2) that "smaller" companies don't have to do because they were involved in anti-trust suits many, many years ago.

All companies don't give a hoot about their users/customers/etc. They just want to make money. That's all. Customer and employee satisfaction can be a tool used to get that goal, but some companies (ex, the PC graphics board manufacturer, Diamond) don't even need customer satisfaction to keep going.

Hey, neither does Atari.

Just curious about your hatred of IBM; I don't particularly trust a company that large either, but I have a good feeling about PowerPC. If PowerPC doesn't do anything else, at least it should drop the price of other RISC workstations....

I've built a version of MicroEMACS 3.12 that works great in a window,
since it just uses termcap calls; I'm pretty sure I put it on
atari.archive some time ago.

Something like JOVE or Elvis would also work well in a window; JOVE is
an EMACS clone, and Elvis is a 'vi' clone.

Could this be accounted for by the lower instruction fetch cycle overhead
when using move.l ? If using 2 move.w instructions to fetch data as opposed
to one move.l, an extra instruction fetch will be required.....adding a time
overhead.......

I'm english, and I don't speak another language (I understand a little written German, a little french & a small amount of spoken Cantonese).

I find it very embaressing to have to admit that, but most people in english speaking countries don't have any real pressure to learn another language. This is arrogance on our part, and we should try to improve it.

Point.....

Working through loads of german software has improved my understanding of german greatly.....which is a GOOD THING.

> powerfull machine using high-perfmormance RISC processors (20 MIPS and more),
> DSP's, highspeed-graphicprocessors, 16 bit CD quality sound, 16.7 Mio colours,
> etc.

The difference is that the CD32 is out NOW, those with 'high performance RISC
etc...' aren't out yet , and may never come out at all ....(haven't Sony
developed a console before that never made it onto the market?)

> Yeah, even Atari they talked about a faster Jaguar II (40-50 Mhz).

Yeah , Atari seem good at that ......Talking , ...but not doing

And
> you'll think that the CD32 with max. of 256 colours, a 68020 processor with 2.5
> MIPS, the old amiga-sound-system, an the old blitter is cool ?

It's a damn sight better than anything else currently on the market . YES ,
those 'old' amiga chips etc still are better than most 'new' stuff.
I'll admit that the CD32 will be overtaken by more advanced machines,
but not for a while yet.

I hear you say:
> But the CD32 can display 16.7 Mio. colours simultanously ! Yes it can, but then
> there is nearly 0% processortime left for other tasks. The CD32 has a databus
> of about 7 MB/s the Jag has a maximum transferrate of 106.4 MB, so even
> extremly fast games in 16.7 Mio colour mode are possible and done. Don't expect
> to see games like Cybermorph, Alien vs. Predator or Doom on the CD32, the
> Amiga/CD32 is to slow.

Ermmmm actually I don't want games like Cybermorph on the CD32 . This is
because the reviews of it (in games magazines) weren't favourable. Come
to think of it , none of the Jaguar games reveiwed got decent marks.

I hope that BOTH the CD32 and Jaguar do well .

CD32 Good points Bad points

1 CD = massive storage Slower access than carts
2 easy to create games Ugly design
for
3 Quite a lot of games Few are gobsmacking
4 FMV (MPEG 1) Movies come on two discs
(I think?)
5 Games are cheap no FAST RAM

6 Expandable No CD32 expansion for A1200
(yet??!!??)
7 ?????????? Made by Commodore

Jaguar Good points Bad points
1 large storage carts Uses Carts
2 VERY fast access Carts are EXPENSIVE
3 VERY fast processor etc not so easy to create/convert
games
4 Niceish design not many games
5 Potential no CD drive yet
6 CD drive coming soon no FMV yet
7 ????????????? Made by Atari

Oh, I don't know...

With the exception of a few phrases picked up from schoolmates,
and a few words picked up while learning to phonetically
sing some German choral music, I have never studied the language.

When I picked up one of the utilities a while back
(possibly GDOS?) and found the documentation in German,
I spent a little time skimming through it, and found that
I was able to get by. If that can be done without intentionally
learning the language, what could be accomplished with
a little bit of effort.

The real problem is that, regardless of which language is
most commonly used, most languages have some national
connotations; to be truly international, we should be
programming in Esperanto. (Or, perhaps to be
truly universal, in Klingon. Who's got that font, again?)

Hi, everybody !
I've been following the discussion on German programmes with(out) English documentation for a while now, and IMHO most of the contributers missed the point.
It's useless (and doesn't belong to this group) to discuss the importancy of several more or less common languages.

Personally I'd like every author to produce two versions of his software: one in his native language and one in English for the benefit of the rest of the world.
But this puts an additional task on the non-English-speaking people and one (Hi, Ofir) shouldn't demand this, but you may of course ask the authors of the programs you like to release an English version.
BUT it is the choice of the author - remember he or she is the one who sacrifies his time -, which languages he'd like to support and you'd respect his personal decision !!!

Another not mentioned point is that the atari has by it's graphical user interface the image of an "easy to operate" computer. That would be damaged if only English versions were published. Besides, I've been very disappointed by programs that don't support the national umlauts, so I enjoyed pure German programs because there's no trouble int that respect - a problem most English speaking authors seem not to have recognized so far.

Try to remember that we internet users are not representative for the average citizen, most of us have an academical education. In every country - except the English speaking ones, of course - the majority of the people isn't able to understand more English than maybe "yes" and "no". So - no matter how small the "market" may be - native language versions are always welcome.

And you've always a lot of choices encountering a program in a foreign language:
1. persuade the author to release an English (French, Cantonese or whatever) version
2. ignore the program and look for another
3. write one on your own - of course with only documentation in Swahili !
4. BUY A DICTIONARY AND USE YOUR BRAIN !!!

Hello Al!

>1. What is it?

It's the newest ATARI Computer.

>2. Why do people want one (ie: What is it mainly used for? Games, etc..?)

That's a difficult question. You can use it for all the things you can use
ATARIs for: music, dtp, games etc.. And you can use it for HD-recording!!!!

>3. Why is it compared to the A1200 all the time?

I don't no. Perhaps it is working with DC (direct colour)?

>4. What does it look like?

It looks like computers of the 1040 series of ATARI.

>5. What kind of a processor does it run?

MC68030 with 16 MHz and a MC56001 DSP.

>7. What peripherals exists for it? (Can it be conencted to a regular VGA/SVGA
monitor and such?)

You can connect it to a regular VGA/SVGA, RGB and TV.
There are a lot of peripherals for the Falcon (in Germany):
- S/DIF Interface
- Genlock
- Mighty Sonic (32 Mhz accelerator with a real MC68030 and fast-RAM card)
- Eagle Sonic (same as Mighty Sonic without fast-RAM)
- Highspeeder 40 (40 Mhz accelerator)
- Power up 2 and Skunk (32 Mhz accelerators)
- Falcon Speed (286 DOS emulator)
- Screeneye (video-digitizer)
- Black Mail (voice mail system)
- Afterburner 040 (MC68040 board with 33 MHz and fast-RAM card / Comming soon)
- 486 Emulator (coming soon)

8. Where the heck does anyone get ANY software of any kind? (ie: Non PD/share
ware stuff, that is...) Does a commercial market even exist?

Yes! A commercial market exists. Now, there is a lot of special software for
the F030. You can get special games (Ishar, Transarctica etc.), special music
soft (Cubase Audio, Digitape etc.), special picture viewer (JPG-View [with
DSP-support] etc.)

9. Is the OS capatible with anything out there?

The OS is a new TOS (4.01 - 4.04).

Bye
Olaf

I don't know if it's still around, but Maxon Application Construction Set used to be sort of a case tool. If anything it was a bit like DevGuide on the Sun or Visual C on the PC.

As to proper case tools? I would be very suprised. They go for big bucks on other platforms, and the money just isn't in it to build an atari version.

I see by your previous post that you don't use Neodesk with Geneva either? That's not a slam against Neodesk, but high praise for Geneva! :-) The extensive hot key system(even on the file selector!) makes a desktop virtually unnecessary, IMHO. When I first got Geneva last fall, I tried using Gemini and Terradesk for traditional desktop functions. However, I soon unloaded them as they were only taking up hd space. BTW-have you got Calamus SL up and running under Geneva? I have tried, but even changing flags doesnt help. (I use a 4 meg STE). Lastly, I am running Stalker, Harlekin, Lattice C and Superbase together, makes for a nice integrated system! :-) What do you use Geneva for, if I might ask?

> need a patch utility, but what happens when I have not
> used the patch utility?

The computer thinks that it has got 4Mb RAM. But if you
access the non-existing RAM you will infact access some of
the existing RAM.

The 2.5 Mb patch is active until next cold boot. So if you want
to play an autobooting game, just run the patch, insert the game
disk in the drive and press reset. Most games works without
the patch because they only use the lower 512kb.

:although I do have a \CLIPBRD folder in my boot partion and the
:environment variable CLIPBOARD points to the same path and this works perfectly
:with all other programs that support the clipboard.

Try using setting the env. variable SCRAPDIR instead (or as well as) CLIPBOARD
I've seen programs that use this; in fact I think that SCRAPDIR is the
correct one to use.
An alternative is to use the Atari Clipboard CPX, which I presume does a
scrap_write() to set the clipboard directory at bootup.

Incidently, does anyone know for sure whether CLIPBOARD or SCRAPDIR should
be used? What do the Atari developer docs say? I think the Compendium says
SCRAPDIR.

Hmmm... I should not be having any problems in that case, although I am
becoming surer that the problem is with the drive, as the Atari HDX utility
will format the drive, but the ICD Pro utils will just lock up on me.

I believe there is an ST port of the program SOX, which can convert between
many different sample types. If not, there are numerious UNIX versions.

Please explain that. I don't think that Germany has problems with accepting
English (compare to France). In fact, Germany accepts that German is not
`official language' of the European Union (French and English are, although
more people in the EU speak German then French as native language).

However, most German users prefer German program texts and documentation.
There are around ~100 Million German speaking people (Germany, Austria,
parts of Swiss), and in the past, a very large percentage of Atari machines
has been sold to this market.

BTW: Most dutch users understand English, but many among them understand
German, too. That's what I call good education.

>A question: What percentage of Atari users understand English?
>Answer: 99.99999%

That would be nice, but fact is: a lot of users in Germany can handle english
program texts, but they won't read english documentation.

>A question: What percentage understands German?
>Answer: maybe 30%
>
>Conclusion:...

Well.

(1) My non-commercial programs come with english and german program texts,
but I just don't have the time to write english docs. Besides, I don't think
that my English is good enough for writing english docs. If someone is willing
to do that for me, fine.
(2) Would you care to support an english version of a shareware program
if the number of registered users from *Swiss* is five times higher than
all registrations from english speaking countries? I wouldn't.

>Joe has under his wing would have been in English at all.

I applaud schemes like this definitely. But I personally couldn't
register a German program that I wouldn't use because of language
difficulties; just on the off chance that the author might create
an English version, no matter how good the software might turn out
to be. If German programmers want English speaking users to use
their program, they should consider providing an English version. I
know this is a bit like the Chicken and the Egg problem, which
should come first: an English speaking user base or an English
version of the program???

I'm not a linguist but I _can_ understand (with help from a
dictionary) a little German, but I'm not ever _comfortable_ in
using a program in another language. If I'm not comfortable with a
program, I don't end up using it! It is a pity as there definitely
seems to be a lot of very good German software. I only wish I could
use more of it!

The VERY BIG PROBLEM WITH GERMAN SHAREWARE is the PRICE..!!!!

I was looking at the Shareware price I think for Kabold_2, some thing
like 110DM, gee this is even dearer than Codeheads MaxiFile..

From what I have been told here by a German friend, wages are Very Very high
in Germany, this also must reflect into the Shareware prices asked...

In most cases I have look at, German shareware prices are even higher than
Commercial software...

Or could it be that because there is no English version, then they don't sell
that many and that ends up with higher prices..:-)...

Food for thought...!!!!

Well, then, you just made a sale. As long as the MiNT/PowerDOS version will be a free/cheap upgrade, I'll ring up Toad (or maybe STeve's) and buy it this week. I was resolved to not buy it until that compatibility was at least planned...

I like NeoDesk, personally. I only have version 2, but it's a great little program... Until I get Geneva, though, I'm using NewDesk!

One quick Geneva question: If I use geneva with Teradesk, will I only be able to launch one application from Teradesk as ST Format implies? I haven't been able to find any other reviews of Geneva...

Also, is Geneva compatible with NVDI? That'd be cool... PowerDOS as the DOS, Geneva as the AES, NVDI as the VDI, NeoDesk as the desktop... Where'd TOS go? *grin*

And are there any plans for the cart-based version of Geneva that Dan talked about?

laters, all...

.s.

PS: I just got AtariWorks/SpeedoGDOS. AW is version 1.2... It seems rather incompatible with NVDI/TurboST. Also, the install programs were BOTH incompatible with Selectric (v1.10e)! And the disks all had identical serial numbers so TOS thought I hadn't changed disks!!! I finally had to install everything by hand...

But I have to say, AW/SG is a DAMN FINE package for general work!

What with the common diskette formats and the existance of FalconSpeed and the great performance hit of emulating a foreign processor I think that SoftPC for Atari will never show. Most importantly, the raw cpu power of the 16 mhz 68030 will translate **UNDER SOFTWARE EMULATION to perhaps a 8 mhz 8086 A 386 can emulate an 8 mhz 68000, too. There is a big hit involved here; the only way software emulation might be tolerable is under a RISC archetecture or a egg-fryer (Pentium, Alpha, 68060) environment.

According to the latest Atari Explorer Online (304), there is a BUG in
the newer versions of AtariWorks called "the Blank Page Syndrome"!
Has anyone heard of this? Can anyone post more information? I'm SURE
it'll be VERY interesting for those of us who use it!!!

Also, can anyone point out a source for some more Bitstream fonts for
SpeedoGDOS? I hear there is a PC font package with Bitstream fonts in
it...

Maybe there are some available online?

Thanks,
.s.

0{{ "anisko" == anisko <anisko@usdtsg.DaytonOH.NCR.COM> writes:
anisko> You can switch between 8mhz, 16mhz (no cache), and 16mhz
anisko> (cache) as simple as running a small program (see the
anisko> atari/Ste directory at atari.archive.umich.edu), or just using
anisko> XControl 1.31 (you can switch the speed in the GENERAL.CPX).
anisko> There's no *physical* switch to throw.

I use a little auto program called "speed". It sets the MSTE to
16/cache when it runs. Thereafter it allows you to switch between
8/no cache and 16/cache by pressing ctrl-alt-keypad+ or -... Also it
lets you type "special characters" like on a PC with alt-keypad
combinations...

anisko> I dunno about the games. Some things (games with copy
anisko> protection in particular) may work under 8mhz, etc (since some
anisko> protection is timing sensitive). But for most things, the
anisko> MegaSTe is quite nice (and the external keyboard makes it
anisko> worth it :-) As well as the high density drive...

I've only had some problems with copy-protection which relies either
on the 8 MHz clock or the old floppy controller. I have the AJAX/1.44
drive and some games refuse to run... Also, of course, non-STE games
like Populous don't run...

In general, I LOVE my MegaSTE! It's basically an ST with all the
goodies, whereas the TT and Falcon are different computers entirely,
IMHO. Nice MSTE things:
The keyboard (yesyesyesyes!!!)
the speed (about 170% faster)
the BLiTTER (I had an STf before...)
The 1.44 meg drive
the internal hard drive
DMA sound
TOS 2.06
GOOD serial ports (I use HSMODA02 on Serial 2)
can't beat the prices! (thanks, Bry!)

just get one!!!

hate to burst your bubble. Educational and street prices are about the same.
For example, the LC475 and the Q605 are the same cpu with different names and
disribution channels. The LC475 can be had for $823(UNI education) and the
Q605 has a street price of $849(J%R computer world).

I contribute when I can. I still get mail from atari owners who did not realise
that Power with out the price is in the Mac's corner.

AFAIK Kobold 2 is *not* shareware, but payware. It used to be distributed
by Kaktus, not sure if that company still exists.

> In most cases I have look at, German shareware prices are even higher than
> Commercial software...

Than you haven't been looking at the prices of *german* payware, I suppose :-).

Side stepping the issue again... Now post the street price of the DSP macs vs
the educational pricing. Since the Falcon has a DSP, and many of it's users
consider it a key feature of the machine, your drivel about LC and 605 pricing
is meaningless.

Have you even touched a Falcon or seen one operate Peter? I didn't think so.

4688. Tape Backup revisited

Newsgroup: comp.sys.atari.st
Date: 1994-03-10 03:18:09 UTC
From: whitema@rtsg.mot.com
Message-ID: <2lm3hh$ai@delphinium.cig.mot.com>
Source record: 191345

A few months ago, I posted a request for information on tape drive backup programs and information. Well, from reading AEO and chance downloading a utility or two, I found a company that sells drivers, backup software, and tape drives:

Beckemeyer Development
P.O. Box 21575
Oakland, CA 94620

Voice: (510)530-9637
Fax: (510)530-0451
BBS: (510)530-9682

I received a letter from them today.
They sell a backup kit tool (US$49.95) or just the drivers (US$20).
These are for SCSI drives and claim to work with any adapter.
They also sell new and refurbished SCSI tape drives.

I'll probably give them a call tomorrow to place an order for the software, but may order the drive elsewhere (they're a little on the high side for new).

Yes but it is also *much* better than Maxifile. It can do backups,
optimisation, run scripts and it is very fast, probably 3-4 times faster
than Maxifile.

Actually, an application `should' create a clipboard if none exists.

Personally, I think programs should store the clip internally if no
clipboard is found. The clipboard is slower than insternal storage,
and if the user hasn't installed a clipboard, they probably aren't
going to be cut/pasting between applications anyway!

(Of course, the current version of GEM++ supports the clipboard)

>anyone enlighten me?

Yes, I have. In fact, I can not only get it to run from hard disk on
my TT while MTOS is running, it even runs while my NOVA is installed (but the
output is still on the built-in video port as it apparently goes straight to
the hardware for its video, rather than using VDI...). Of course, I have it
installed on F10 for that quick-action load when I find the NEED ... :)
I didn't have any particular problem loading, and it is not in any
special directories. I presently have it in D:\GAMES\POPII .

This, my friend, I find very hard to believe. We, the Dutch, are usually
bragging about the fact that Dutch is a very difficult language to master:

vind je niet Martijn? Nou kan het natuurlijk zijn dat hij de 'manuals'
begrijpt omdat er zoveel engelse termen in voor komen. In dat geval zou hij
eens een Belgisch programma moeten proberen. De Belgen zijn wat vindingrijker
in het bedenken van Vlaamse woorden voor nieuwe technische begrippen.

Got that? :-) ... This man's a genius.

Yes, French TV is almost as bad. What I mean is that everything is dubbed.
If you had subtitles you (the Germans in general) will have a better grasp
of English and other languages.

>all registrations from english speaking countries? I wouldn't.

I think the situation is changing in the UK. The magazine I write for is pushing shareware and we had some success with Selectric, Everest, GEMView and Kandinsky. All English versions of German software.

Maybe German authors should at least provide the program and resources in English if they can't/don't have the time to do the docs. That would be a start.

Take Gemini which is better than Neodesk in my opinion, but is not in English. Users would rather pay for Neodesk than battle with German dialogs.

Maybe there's no logic to what I am saying, but it is very frustrating for people like me to miss out on so much excellent software that comes from Germany.

800x600ix256c (or even 65536c) is absolutely possible on an RGB monitor
Of course, you've got to "hack": but not in the way you hack to get overscan on
an ST. Here, if you can't get this mode on a Falcon, it's only beacuse Atari
didn't want to make it accessible, BUT IT IS REALLY EASY FOR THE VIDEL. Which
means that if Atari wanted, it could do it easily.

4704. Re: tempus word demos?

Newsgroup: comp.sys.atari.st
Date: 1994-03-10 09:59:15 UTC
From: richara@westminster.ac.uk
Message-ID: <CMG12r.8L@westminster.ac.uk>
Source record: 191261

Thanks for all the info:

I did manage to get a demo of Tempus Word, circa 1990 or possibly '92,
I forget, version number was low.

It looked very fast and very pretty, with the ability to move from WYSIWYG
to text mode like tempus2. Since its all in german I couldn't do much more
with it, I also couldn't tell if it had a spell checker or a thesaurus.

It did have a little note pad that I liked and could use something like that
for off topic ideas when I'm writing stuff.

But it's all in German so its not much use to me. Sigh. And I don't want to
start the 'write all software in English' thread again, although that would
be nice :->

: What I think is Great is Script III, very very nice, its a shame its
: German, I do have version 1 of Script......

Hmmm, another program I haven't seen.

I did look at redacteur 3 though, and it looked fast. The demo screwed up
a little bit a few times though. I think it gets a lot of speed by changing
the keyboard repeat rate, and sometime it didn't change it to a normal
level, so in dialogue boxes text entry went >>>>>> WAY to fast.

But that was probably a problem with the demo. It also had a nice note taking
feature but unfortunately no English thesaurus, and according to those nice
people at the ST-Club no plans to make one, there were, but they have been
shelved.

So I guess its protext for me then.

4706. GIF conversions

Newsgroup: comp.sys.atari.st
Date: 1994-03-10 10:35:26 UTC
From: mcnaugra@vax.sbu.ac.uk
Message-ID: <1994Mar10.103526.5371@vax.sbu.ac.uk>
Source record: 191263

I've been converting GIF and JPEG files downloaded from the Internet, mainly using Gemview and PhotoChrome. The problem is that if the picture is less than 320 pixels across or 200 down, PhotoChrome stretches the image with blank lines.

Does anyone know of a utility or routine which will 'pad' GIF files to a given size with black borders to enable PhotoChrome to convert them correctly?

> or language directories.I dont know whether or not it works , but
> as its written by a falcon owner I would assume it would.
>
> Les
>

STOS fix 2.7 seems to take a different approach to previous fixes; instead of trying to fix a program to work on all TOS versions, it reads the system variables from the machine you are running it on and fixes the program to use those. This means that it's no good for making your own programs work on other machines, but very good for fixing other people's programs to work on your particular version of TOS. It was certainly better than BASICMJH at making STOS itself compatible with my TOS 2.06 machine.

I don't know about the Falcon, but as Les says, if it's written by a Falcon owner I would imagine it would work with Falcon versions of TOS, although programs which use extensions may still try to access system variables which aren't covered by the fix.

Source record: 191265

This is a repost; sorry if you've seen it before, but our mailer has been down and I don't know if it got through.

Yesterday I downloaded an old game called Topas from ftp.uni-kl.de. It looks very good; elements of Archon, and some ideas which I was going to put into my own Archon variant (don't you just hate it when someone else has got there first!)

Anyway, this is the PD version, and it's in German, so my questions are:

Why have I never heard of this game before?!?

Was an English version ever written (if not, I guess that answers the first question)?

Are the original authors still around and willing to write an English version, or get someone else to translate it?

Most of the game is quite easy to understand, but from some of the filenames and my limited knowledge of German I get the impression that one of the options is a quiz element, which would definitely be beyond my translation abilities!

>install the SIMMS?

Without the patch utility, the STE will think it has either 4MB or
1MB, depending on the order in which SIMMs are installed the patch
documents should tell you the correct way to install them). The way
the patch works is that the hardware THINKS there's 4MB installed, but
the patch tells TOS that the upper 1.5MB isn't available. One problem
with the patch, though, is that it won't work with a number of games,
plus it can be a bit flakey at times.

A game like WOLFENSTEIN 3D or DOOM _should_ be doable on an ST (after
all, they have WOLFENSTEIN 3D for the vastly underpowered SNES!!!),
but I don't know of any ever developed. There IS a shareware one from
France for the Falcon in development, though.

: I believe there is an ST port of the program SOX, which can convert between
: many different sample types. If not, there are numerious UNIX versions.

There is indeed an St version of Sox available, although it is a little unuser friendly and needs a shell such as gulam to run it. It should be in one of the bigger ST ftp sites, try src.doc.ic.ac.uk in packages/atari.

Not that this is off the subject or anything, but you can get in quite an argument over whether a Chinese language actually exists. In fact, such an argument has been going on over on sci.lang for the past couple of months, with many oriental names involved on both sides of the argument. I don't think we'll settle it here.

For those who don't know, the problem is that the Chinese government claims that Chinese is one language with many dialects, pointing to the fact that all Chinese is basically written the same and can be read by any literate Chinese. Bear in mind that written Chinese carries meaning but not pronunciation information. As spoken, the various "dialects" of Chinese vary more than the "languages" derived from Latin in Europe, so how do you define "language" as opposed to "dialect"? I don't pretend to know the answer, and if the linguists over on sci.lang can't settle it a bunch of Atarians sure won't.

FWIW, the "official" dialect/language of China is Mandarin.

As for German vs. English, there's nothing "better" about either language. It's really just a marketing decision. To do well in the German market, you need to have a German version of your program. To do well in English-speaking (or mis-speaking, in some cases) countries, you need to have an English version of your program. Since those are the two largest Atari markets, a good marketing case can be made for expecting anyone in a country where neither is predominant to adapt or not buy and to heck with any lost sales. I would expect France to be the largest of the non-English-or-German markets to see greatly-reduced sales from this approach. If either a German or English speaker decides that it's not important to him to do well in the other market, then he accepts the results of that decision. Let's quit beating each other over the head with our native languages and go fix each other's Atari problems.

>1.10 at the most, maybe even 1.03.

I can sort of see why he did the numbering convention, though it is
confusing. The first version would be 1.0 typically, but it's also
the 1st release (a la "release 001"). And the numbers keep incrementing
(perhaps he should have left the release # off altogether, or
maybe started inserting decimals, a la "Geneva 1.02.003").
Oh well, it's an awesome product regardless of numbering conventions :-)

MiNT compatibility is definitely a need for me (half my hard drive
is on minix partitions). I do have a question/suggestion though.
Will the Geneva file selector (and any other appropriate items)
be able to handle the "unixmode" extended filenames (such as
"This_File.here").

My basic setup is to have one partition (a minix one) used solely
for downloads (which is no problem outside of Geneva) which I can
set easily in CoNnect. With Geneva loaded, this is a no go
(I download to a regular partition, boot up with MiNT, and copy
everything over until I finally get around to dumping stuff out to
floppies)...

Source record: 191282

Hi,

please can give me someone informations about attaching an additional
floopy drive on a Mega ST computer. - Not a "normal" Atari drive - I
would be interested in a 1,44 MB or even 2,.. MB drive. Of course I want
to store 1,44 MB on one disk, e.g. I don't want to attach a 1,44 MB
drive and format the disks only with 720 KB.

Are there some software changes necessary? (I think so,...???)

Any information or pointer to a ftp-site would be appreciated.
(I hope this is not a so called FAQ - I didn't found something in the
newsreader)

True. The nice thing about Ansiterm (from when I tried it out)
was that you could get the full 16 color ANSI going on any ST
(I think it basically puts you in ST LOW mode, and uses custom fonts).
The fonts are a little small (anyone remember VT100 or Kermit-65 on
the Atari 8-bit?) but worked rather well. Ansiterm's not nearly
as sophisticated as CoNnect, but does the job it sets out to do...

I bet you do need an Falcon to do Good realtime texture mapping,
altough in Legends of Valour there was an decent texture mapping, but
an ST that was not what you were lookin' for. In Falcon there is
the Lasers and Men (or something like that) B-)

This is an evaluation version, so the user can have a look at the features and read the docs the understand how it will work. It will of course not be fully functional unless you have the hardware.

Hello,

This might sound kind of silly, but I am interested in learning about
GDOS, as I have never dealt with it. I know there are programs that I
that will use it if it is available, so I would like to know where to
get GDOS. Wasn't it released for everyone to use? If so, where
can I get it. I did pick up the GDOS FAQ that was released earlier.
Also, where does one get fonts for it?

Thanks,

Joseph

Who uses a program without being able to understand the manual? (If the program for example mentions "HD-Driver patch" in the doc!)

MultiUser is probably a program I want very much, it seems like it does whatever I want it to, but I DON'T understand the part of the manual that talks about patching my HD-driver ... thus I don't dare installing it .... thus I do not know if it's what I what .... and I will not be ABLE to registre it!

If the program had an english manual (don't care if it's in poor english, as long as it's there!) I might'd been a registered user now ..

This is what I mean, and I will stand by it.

|> A game like WOLFENSTEIN 3D or DOOM _should_ be doable on an ST (after
|> all, they have WOLFENSTEIN 3D for the vastly underpowered SNES!!!),

The problem is not really the CPU speed (or lack of it) but the bit plane layout of the ST's screen. In texture mapping you have to handle pixels individually (as opposed to sprites where you manipulate horizontal blocks of pixels) and in ST lo-res this means a read/mask/write operation in each of 4 bitplanes for each pixel written to.

AFAIK the SNES internals are confidential, however I would not be suprised if it has a chunky graphics mode where you only need 1 write operation per pixel. The Falcon's TC modes are chunky and this is what all the Falcon texture mapping demos use.

It allows you to edit save game files and completely redo the
dungeons! A really neat program... I've seen two of 'em. The first
only worked on non-STEs, and there was a complete rewrite of it
included on the Feb '94 ST Format, which I have. I'll upload it to
a.a.u.e if it's PD/Shareware...

I've also seen a neat little editor which hooks into the game and is
called when you press alt-help instead of print-screen...

4748. MicroTron 3.0 > 2400 baud?

Newsgroup: comp.sys.atari.st
Date: 1994-03-10 18:29:50 UTC
From: selick@acs3.bu.edu
Message-ID: <2lnouu$q7u@news.bu.edu>
Source record: 191205

A local Atari bulletin board that I call is running MicroTron BBS software v3, and claims that all attempts to run it with a 14.4 modem have failed. Is there a newer version of the software to allow it to run with non HST 9600 baud and faster modems? Is there a known fix for this problem? Is there another BBS package that will allow the sysop to use his own additions to MicroTron while giving him new features like 14.4 support, zmodem, etc.?

Thanks for your help,
Steve

The street price of a Quadra 660AV 8/230 is $1699(J&R music world) versus $1506 from the University of Northern Iowa with the same configuration. The Q660AV is a much better buy because of the 040, extra memory and HD space, wealthof software, dealers everywhere and is backed by Apple.

CM> One, I would like to get a terminal program that can run PC-ANSI. Does
CM> any one know if PD or SW of this type of program exists?

First, and this one is the best of the two, is AnsiTerm v1.90 by Timothy Miller/Two Worlds Software. It does 80 column, 16 colour ANSI in low resolution (will switch automatically from medium if necessary) using a 4x8 font, and is very quick. A little bare-bones as terminal programs go, but nice and small, and features a capture buffer/editor, dial menu with autodial, macros, all download protocols (using XYZ.TTP external module) and other features.
The second is called TAZ from Neat 'n Nifty, which does 16 colour, 80 column ANSI in medium res using page flipping to get the enhanced colours; the result is VERY flickery, but if you can put up with it, it's a very nice term program that has a few more features than ANSITerm, and looks a lot like Telix on the PC.

CM> Secondly, I would like to set up a SMALL BBs (520ST with Single Sided
CM> Drive) for use in my local area (Kanata Canada). Again, is there a half
CM> decent PD or SW BBS I could use?

Transcendence BBS v1.x.x has just gone completely Freeware, and IMHO is the best BBS program in the SHareware/Freeware domain. Unfotunately it's large, and will deffinitely not run on 512k with a SS drive. For that, you might want to look at either STadel, Fnordadel, QuickBBS-ST or a few others. If you're a member of CRS Online in Toronto, you can get all of these and more in the Atari ST sig file sections. (As well as the aforementioned terminal programs)

RE: TOWER POWER

I got the game, and it's fairly decent, but I have a few beefs about it:

1) Poor hard drive support; it wants all its data files on the root directory!
2) Relatively poor graphics (could have been greatly improved)
3) Amusing, but mostly unintelligable sound effects/speech
4) No one-player option
5) No game board editor; four power squares are too few IMHO
6) Useless character editor (wants MBK files, and there are none in ANY of the archives)

Other than that it's fairly decent.

4758. Hung notes with Notator Logic in midi synch mode.

Newsgroup: comp.sys.atari.st
Date: 1994-03-10 19:44:17 UTC
From: tjl@siva.bris.ac.uk
Message-ID: <CMGs5t.7q3@info.bris.ac.uk>
Source record: 191215
Cross-posted to: rec.music.makers.synth,comp.sys.atari.st

Hello, it me again with another problem.

I got my Notator Logic for Atari-ST kit recently. I spent a few days getting into the Logic way of working and like it! However, I then encountered a problem that really has stopped me using it and sent me back to Notator. When recording or playing in MIDI synch mode I get very frequent hung notes. This does NOT happen with Notator.

My setup: Atari 520STFM with TOS 1.02 and 2.5meg RAM. Novation MM10 keyboard. Yamaha QY10. Notator 3.21/Notator Logic 1.7. Yamaha MT1X 4track. Phillip Rees 2m midi merge unit. Tascam MTS-30 Smart FSK Midi Tape Synchroniser.

Its not possible to record or play (via MIDI thru) for even a few bars when synched to tape without getting a hung note. I tried very hard to reproduce this problem in Notator 3.21 but with no sucess. I exported a track with hung notes from Logic to Notator and looked for missing notes. It seems Logic does not flag missing note off's in the event editor like Notator does. Instead a note is set to last to the end of the recording. I also tried a LOG3 MIDI out as well.

I rang Sound Technology and asked if it was a known prob, they said no. They also said that although EMagic say Logic is supported under TOS1.02 it is not tested on such systems.

I would be interested to hear from anyone who is using Notator Logic on Atari in MIDI synch mode. Do you get hung notes? Its very possible it is my MIDI setup at fault so if you are sucessfully doing this I am just as interested. I hope to try and reproduce this at a friends studio sometime, but we are both very busy.

Also, I tried to subscribe to the EMagic mailing list mentioned here a while ago, but my mail never got delivered (unknown host from remote mailer). Anyone here managed to get onto this?

Cheers, and thanks a lot in advance.

>
>Of course it is relevant. Get real, the majority do not understand German.

Ah, but that's where you're very wrong. Out of the total number of STs
sold worldwide there are *more German* than all others combined! (I don't
have the figures handy but I wrote an article about the German ST market
a while back and obtained the actual numbers.) So the *majority* of ST
users *do* understand German!!! Moreover, it's probably their native tongue!

The reality is that the english language STs are actually a minority.
It's only natural that the German (or any other!) developer produces a
program for the largest potential market! Especially taking into account
that a German language program can also be sold in Austria, Switzerland,
as well as Holland, Belgium, the Scandinavia, and these days a sizesable
chunk of Eastern Europe too.

So it's nothing to do with languages per se, just plain business sense/market
research... The German market is the biggest. Period. All Atari insiders
(and most outsiders :-) are well aware of this fact.

So the difference in price between a Falcon and a Quadra at least $500, now
add the price of Midi Support to that of the Quadra. Granted, the 040 is
nice, but it's not essential, and it can be added to the Falcon for not much
more than the difference in price of the two machines. Or, with that same
amount of money, ALOT more hard drive space could be added to the Falcon,
something musicians could use alot more than an 040 (not to mention the built
in midi.

>No I have not because there is no Falcon dealers in my area and or in the state
>of Iowa(?). I never said that the Falcon was not good, but is a dead platform.

Guess what! Your wrong again! There is a dealer in Mason City Iowa, just two
hours north of you. I should know, It's where I bought my Falcon. And how
come you are quoting prices from a Mac dealer in New York? What? You can't
buy an AV Quadra on every street corner? 'Dead Platform' is a subjective
term, and they way that you use it regarding the Falcon only makes YOU PETER
SINCLAIR-DAY look like a stupid little child trying to start a computer war.
I have absoulutely no problem finding LOTS of useful software for my Falcon in
the PD world, and there's more commercial software out there then I will be
able to purchase anywhere in the near future. Since the software that I want,
and that many others want, IS readily available on the Falcon, and there is
more available every day, I want to know just HOW the Falcon qualifies as a
dead platform. Granted, you can't buy a Falcon everywhere, and there's not
thousands of pieces of software out there (how many can one person really use
or buy unless they are a bigtime pirate), but in some ways the machine is thriving.

>Peter Sinclair-Day
>University of Northern Iowa
>Cedar Falls, Iowa USA

>March 14 - Power Mac at UNI!!!

I hate to break it to you Peter, but Apple is not the only company using the
PowerPC, and the entire idea of the chip is that it can run multiple OS's.
It's very likely that companies like Commodore and Atari will use the very
chip that you are touting so much to compete AGAINST apple, and in the world
of the PowerPC where any machine can run any OS, many of Apples advantages
will be null.

Regardless, I think the PowerPC Macs will be nice machines, but I'll wager
that someone else will put out a better, cheaper clone before long... I'll
wait until then to buy...

I tried to explain this before, but if even Ofir, an inhabitant of the UK,
is not aware of these facts, I wouldn't be suprised if 99% of Atarians in
USA, Canada, Australia, etc. are unaware of the european situation.

> BTW: Most dutch users understand English, but many among them understand
> German, too. That's what I call good education.

In long forgotten times the dutch educational system was successfully
teaching english, french, german, latin, and ancient greece to its pupils.
Nowadays it is not even capable of teaching the main principals of the
dutch language to our youngsters :-(.

Most people in NL will understand english as it is the main language on
dutch radio/televison, and german as it resambles dutch.

> (1) My non-commercial programs come with english and german program texts,

This might well be a chicken and egg problem. If one can't understand the
docs, one is not likely to use (== register) the software. Or were you
referring to shareware packets that are fully bilangual (like Connect)?

It doen't take a Belgian to know that 'manuals' == 'handleidingen' or
'handboeken'. Of course your signature shows the real problem ;-).

4766. MultiTos problems

Newsgroup: comp.sys.atari.st
Date: 1994-03-10 23:02:48 UTC
From: fnjah@aurora.alaska.edu
Message-ID: <1994Mar10.140248.1@aurora.alaska.edu>
Source record: 191223

My Multitos used to work fine on my 4 Meg Falcon with internal IDE drive, then
I stopped using it for a while and now it doesn't work. I start it up and it
loads all the way past loading desc accessories then it crashes and says
something about aessys errors and then says to adjust debug level and press
any key. But all I can do is turn the computer off.
I will make it to the desktop if I hold down control or shift right after
it starts loading the desc accessories, but then it will crash if I try
opening a drive window with control-A or anything like that.
It does the same thing when I bood off the original floppy.
Does anybody know why this is happening?

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions:
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR] OR use the number address,
NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)

9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once. i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having to reply "y" for each file
when asked "get {filename}?".
12) close [CR] to end (go back to ftp and
13) quit [CR] to go back to UNIX or.......
14 bye [CR] to end and go back to UNIX (or 'close' if you only want to quit the FTP site you're
on for the moment)

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on which the programs
were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after uncompressing .Z and/or .uu.
Use the appropriate uncompress program for this.
- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys, xlinksys etc...)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh, xlba.lzh etc...)
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to another computer (use an
other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:
- mdir [CR] to show disk-directory/space left.
- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)
- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for "low density")
- mcopy a:{filename on disk} {copy filename} [CR] to get a file from disk to computer.
i.e. "mcopy a:dlist.txt dlist.txt"
- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

there's a pc version of 'SOX' on the TX16W sampler site, if that helps.
ftp-ls7.informatik.uni-dortmund.de /pub/tx16w/util/ibmpc/

there are also other sample converters there, but I didn't look too much around in that folder.

ha... That's almost funny, I look at junk mail before I throw it out, that
doesn't mean its valuable, it means that someone is stupid enough to send it.

>Peter Sinclair-Day
>University of Northern Iowa USA
>Cedar Falls, Iowa USA

>March 9 - Apple demonstrated Power Mac at UNI!!

As excited as you are about the Power Mac, I bet you had to put on new
underwear after the demonstration. Peter, you need to get a life or go to a
news group where someone gives a damn what you have to say (If there is such a
place).

Can you tell us why you feel you need to post crap about the MAC in the Atari
news group every day? What psychological problem drives you to do it? Think
about it for a bit Peter, there is a reason you do it and it's NOT got
anything to do with Apple... PERIOD.

4773. a.a.u.e upload: Dungeon Master editor!

Newsgroup: comp.sys.atari.st
Date: 1994-03-11 06:20:02 UTC
From: lancer@wpi.WPI.EDU
Message-ID: <2lp2ii$154@bigboote.WPI.EDU>
Source record: 191230

OK, due to large volumes of requests for it, I just uploaded the
Dungeon Master level editor from ST Format to Atari.archive.umich.edu.
It should be available in a week or so...

I included a little readme file with tips on using the program and a
reformat of the docs into a cute little AtariWorks' word processor
.STW document. It's FULL of fonts (uses almost all the Speedo fonts
which come with AW) and looks pretty when it's printed out in a Maccy
sort of way...

I'm terribly afraid that things are a bit more complicated. The ori-
ginal Eliza was written by Joseph Weizenbaum and NOT in Basic and
certainly NOT two pages.
It was an extremely ingenius program to show people that you can
simulate artificial intelligence without any semantic notion of the
conversation.
The public loved it, and even want to try it out for real. Weizenbaum
was deaply shocked and wrote his book 'Computer Power and Humen Reason'
what computers can't do.
Also the Eliza program is only a *module* of the original program. It
was capable of loading several 'scenarios' and therefore simulating
another person.
Until now, I have never found a port of the original program, and all
the basic listings of 2 pages are certaintly not what I am looking for..
If anyone however has some info, please mail me!

Why is it than whenever you post inaccurate or misleading information about the
Falcon and I correct you with facts and/or information you probably don't want
to see ie the Falcon isn't dead and there is a lot of support for it, you
rarely reply? Don't like the truth?

If I had the cash, I'd buy a Unix workstation. That doesn't mean the Falcon is
crap, just that it fits my budget and does everything I want from it.

Can't help you with this one - haven't been able to really
use Logic yet as I don't have access to my gear.

>Also, I tried to subscribe to the EMagic mailing list mentioned here
>a while ago, but my mail never got delivered (unknown host from remote
>mailer). Anyone here managed to get onto this?

Yes! There are 27 (i think) people here currently. I know Fokke has
been having trouble with his mail server, so try again.

The address to send a request is mtvfb@rivm.nl, Fokke De Boer is
the list maintainer - ask him nicely and he'll be pleased to put
you on!
That is also the address to send messages.
You can also order back issues of the digests from him (there's
been 17 or so so far).

We also have an Emagic developer on the list, Michael Haydn (although
not he's a Notator developer - he's doing SoundSurfer/SoundDiver at
the moment).

Hi ho.

I've just installed an exabyte exb-8200 video-8 streamer on my Falcon.
So, I tried to get it working with gemar.
But no :-(

I got it to load/unload tapes, but when the program tried to write to the
tape, it just hang around - nothing happening for a while. Then it would abort with
an illegal instruction error, or address error, or even worse. And the scsi-bus would
hang with an active busy-signal.
(Luckily I had a program on the IDE drive to reset the SCSI bus).

So, in short, has anyone gotten an exabyte exb-8200 to work with gemar.
OR, has anyone else experienced similar results while trying to adapt a .par file
in gemar - and fixed it.

Erling

SoftPC is the same SoftPC as available for Macs, Unix etc. It is a software
only emulation of an IBM PC. Atari arranged to have it ported to the TT/falcon
and then changed their mind after it was finished. It has never been released
and almost certainly will never be released. It is much better tha PC Ditto. It
runs in a window with the ST desk accesories still available and usable whilst
running DOS apps. If you really want to see it, try mailing
insignia@cix.compulink.co.uk. They told me it would never appear as it would
have to cost about 200GBP. Hardware/faster PC emulators can be got for 55GBP
upwards so SoftPC really isn't worth releasing. It has a norton speed of 0.7 on
a Falcon - hardly breathtaking.

[misc STuff deleted]

>Personally I'd like every author to produce two versions of his software:
>one in his native language and one in English for the benefit of the rest of
>the world.

This is where RSC files are so nice. Like how CoNnect was originally being done, having an English and German RSC file - and all it took was a simple rename or two to get what you need. (I say "how it was done" as the latest versions, english and german, seem to be in separate archives now, but probably the same difference)...

Besides, I can edit the RSC *for myself* to make a version that I can understand a little better. Of course, larger programs are a lot harder to do this with...

>But this puts an additional task on the non-English-speaking people and
>one (Hi, Ofir) shouldn't demand this, but you may of course ask the
>authors of the programs you like to release an English version.
>BUT it is the choice of the author - remember he or she is the one who
>sacrifies his time -, which languages he'd like to support and
>you'd respect his personal decision !!!

True, true. Still, it is a shame when there is an excellent piece of work that is being "shielded" from a larger population. I guess it depends a lot on where you think your potential customers will be from, as far as deciding which languages to use. I just wish there were more Spanish authors, as at least I can translate that language without too much grief :-)

>Another not mentioned point is that the atari has by it's graphical user

>programs that don't support the national umlauts, so I enjoyed pure German
>programs because there's no trouble int that respect - a problem most English
>speaking authors seem not to have recognized so far.

If you think about it, the umlauts, et al were put in by Atari for just that reason, I'd imagine?

Message-ID: <bobhays-110394073205@haysmac.spss.com>
Source record: 191247

I've got a HD coming (finally) and got my memory (the computers, of course) up to 4Meg, so now I can (supposedly) install G++, the GNU C++ (sorta) compiler. This raised some questions:

1) Do I have to install gcc also (the GNU C compiler)?
2) Do I need GAS (the GNU assembler, I think)?
3) Any shell preferences for setting this stuff up?
4) I pulled GEM++ from atari.archive (I actually got in today:-) - any other suggested libraries to get me started?
5) Any other suggestions for someone with lots of programming experience but no OOA/OOP experience?

Thanks and have fun! - Bob

P.S. Email works great - bobhays@spss.com - RLH

|> fussy about those and the order in which they load.
|>
|> --

I had this problem before on my TT with Multi-Tos, and it defintely was
a problem with an Auto folder program. I believe my problem was with
Warp 9, your mileage may vary.

Boot your system and hold down the control key, so that no auto folder
programs load. You should now be able to use the desktop. If you want
to load your desk accessories change resolutions, and they will load.
(at least on my TT they do)

>
>Or could it be that because there is no English version, then they don't sell
>that many and that ends up with higher prices..:-)...

It might depend on the individual authors, etc. For instance,
I think CoNnect runs about $50, which I think is worth it
(not getting back into *that* argument again, just pointing out
prices).

Then look at Gemview. I think it runs around $20 or so, and that
is certainly worth the price to be able to handle all those
graphics types, convert formats, print pictures, etc. Certainly
a bargain.

But again, some programs *are* overpriced - just gotta decide
whether the price is worth it...

Oh, the two examples are available in english, so... hmmm?

Midi support - $40 extra. For the extra $500 is well worth it. Granted the Falcon is nice for music, but the AV Mac is more versatile than the 16 mhz 030. But, on Monday the Power PC Mac 6100 willbe the price/performance champ and will make your 030 16 mhz Falcon look sick.

>

Oh gee.. An atari dealer in Mason City!! It was convenient to quote New York prices because i receive the New York Times daily. Plus I purchase Mac and related stuff mailorder anyway. J&R ComputerWorld is an authorised Apple reseller. As for the Falcon, why doesn't atari have a campus reseller on my

campus like Apple does. And as for software, there is still hardly any commercial related software for the Falcon. Why should i go out of my way to hunt for the Falcon when I can see the latest and greatest Macs at my convenience. The Falcon has lost its ligetimacy as a general purpose computer. Your only argument for the Falcon is its music capabilities but the AV macss has already render that advantage.

Yes the PowerPC can run multiple OS's but third parties like C= and Atari would still have to get a license from Apple to use the system software and roms. And as for those two companies trying to compete, apple has nothing to worry about.
>

I'd be REALLY happy if you can reach the GEnie archives via FTP but I haven't yet found a way... geis.com isn't in the whois server and ftp won't connect to it... You can email back and forth to GEnie using genie.address@genie.geis.com, but that's about it...

Hey, GEnie folks, is there any way to have files emailed to your account? Or perhaps someone would be king enough to upload some of the GEnie stuff to a.a.u.e?

Maybe I'll just have to get on GEnie...

How much does it cost? Are there download charges?

Can Everest cut and paste vertical columns of text? Can it format
them? Can it undo a search and replace all? Does it support 256
colours? Can it edit binary files in hex format? Does it support QED
kurzels? Can it call .TTP filters (Emacs!)? Does it support the MTOS
drag and drop protocol? Does it scroll background windows properly?
Does it allow you to type into background windows? Does it have a nice
3D interface? Does it run in ST Low? Does it speak English? Does it
feel nice?

Check out the demo of the Edith professional (soon to be released on
a.a and comp.binaries.atari.st).

Hi

I need to convert my ST sound sample files (AVR) into Amiga IFF format.
Is there a program that can do this for me? I have 525E, but this doesn't
support IFF. I don't mind going via 2 or 3 different formats, but IFF is
what I have to end up with.

Thanks

Cam

>There is not that much difference between education and street price. I have
>valuable info to contribute because you would not be reading and answering it.

Argh. By this same argument, the idiot with the jackhammer at
6:00 in the morning on a Saturday and the kid who keeps scratching his
fingernails across the blackboard just to watch everone else squirm *also*
have valuable info to contribute, proven by the fact that I'm prepared to
take time to yell at them to stop it.

Actually, I think you have a lot in common with the blackboard kid,
from the sheer bullying insistance of doing what you want to do without
regard to the democratically voted wishes of others, to the fact that I
can't think of any other reason why you would go to this much trouble
unless you just *liked* annoying other people...which is really kind of
sick.
C'mon, Sinclair, even the kids I knew who liked beating up on
kids who couldn't stop them in gradeschool grew out of it shortly after
they left high school. You're just an emotional bully who gets his
jollies rudely posting in the wrong newsgroup because, after all, no one
can stop you.

Maybe it's a "rebellion against authority or structure" thing.
Whatever. Time to grow up, Sinclair.

>8/no cache and 16/cache by pressing ctrl-alt-keypad+ or -... Also it
>lets you type "special characters" like on a PC with alt-keypad
>combinations...

I usually boot up with XControl anyways, as there are certain CPX's that I prefer to have loaded. Since I have my General.cpx set to 16mhz, then I usually boot up in 16mhz anyways (dropping down to 8mhz for things like viewing Spectrum/Photochrome pics, etc)...

>In general, I LOVE my MegaSTE! It's basically an ST with all the
>goodies, whereas the TT and Falcon are different computers entirely,

In my personal opinion, Atari should have not released the 1040STe, but rather the MSTe at a more competitive price. I'm not slagging 1040STe's (they were a nice improvement over my old 1040STf) but Atari should've went minimum with 16mhz at that point...

>IMHO. Nice MSTE things:
>The keyboard (yesyesyesyes!!!)

The main reason a Falcon has not entered my domain yet (and I'd rather have an external keyboard standard rather than hacking around to get an addon keyboard). The keyboard's got a nice feel too...

>the speed (about 170% faster)

I won't argue speeds, as we've seen that thread before, but QIndex (whatever the latest version is) says I'm pretty much at 200% of a monochrome ST (when in ST hi mode) with only the memory down around 170-180%. I don't have the Gembench figures memorized offhand, however, but it is a noticeable difference (though of course, Warp9 or NVDI takes it to a proper display speed)...

>the BLiTTER (I had an STf before...)

Cool for certain things I suppose...

>The 1.44 meg drive

THE main thing (besides the 16mhz) I like - and using a formatter like "PumpUptheVolume" you can have nice 1.66meg floppies (saves a lot of space in my boxes :-) Works great with 1.72meg FDFormatted

floppies from the PC as well (as long as ya change the serial numbers, as
is typical with PC disks)...

>the internal hard drive

Didn't get one (price was a concern at the time) - still, two
harddrives daisy-chained into it work nicely...

>DMA sound

Excellent for samples, MOD files, etc (plus nice to plug it into
my stereo with simple RCA cables)...

>TOS 2.06

TOS 2.05 here. Works fine for the most part...

>GOOD serial ports (I use HSMODA02 on Serial 2)

I run a 14.4k modem on serial 2 as well. Are you using the defaults
of HSMODA02 (i.e. just took them out of the archive and threw them
in the AUTO folder) or did you try using the setting program? If so,
how should they be set (the german was a little more untraslatable
in the program (not docs) than I could deal with)...

>just get one!!!

Absolutely. Besides, it's nice having MiNT loaded, with minix partitions,
and Warp9 - get some serious speeds going. And Geneva works quite
well on it too. I kinda feel like a mini-TT, ya know? ;-)

> System used: Falcon + 4meg + internal HD + TOS 4.01

I've noted the inverse symptom using LED (the off-line reader) under Geneva.
Accessing the clipboard from LED will report the unavailability of the
clipboard and grey out the menu options. Since this does not occur in other
programs using the clipboard at the same time, or under normal desktop
(Neodesk), I must assume that some programs do something that is incompatible
(incomplete) with the way this is handled normally.

It might interest you to know that when this problem has occurred, I've usually
found a hidden SCRAP.TXT file in the root dir of the partition which has the
clipbrd folder. This suggest that the path somehow got lost in the program
which last tried to write to the clipboard.

>
> I am looking for METADOS to plug an CDROM to my AdSCSI+ card.
> [...]
> BTW : I am not sure to have understand everithing : is this software
> enough to make my STe recognize the CDROM ?

Well, not quite, you require a driver routine too, actually several to be able to read different CDROM format disks.

Let me quote ICD on this...

[-v-<snip>-v-]

[... from the ICD doc-file on CDROM drive using METADOS ...]

INSTALLATION

Installing the CD-ROM software is fairly straightforward. On the disk will be two folders; AUTO and METADOS. The contents of the AUTO folder need to be copied to the AUTO folder on the current boot drive (C: on systems with hard drives). The entire METADOS folder needs to be copied to the boot drive.

[... sample cfg file for METADOS omitted...]

The line '*BOS, \METADOS\ICDCDROM.BOS, A:1' loads the ICD CD-ROM device driver (ICDCDROM.BOS), assigns it physical ID 'A' (physical device IDs have no connection to logical drive letters), and specifies that the CD-ROM drive has been configured as DMA device 1. The physical ID can be any letter from 'A' to 'Z' as long as all physical device drivers have unique IDs. The device number must match the ACSI/SCSI ID of the CD-ROM drive (0-7 = ACSI 0-7; 8-15 = SCSI 0-7).

The lines '*DOS, \METADOS\HSMAY86.DOS, Y:A' and '*DOS, \METADOS\ISO9660F.DOS, Z:A' load the High-Sierra and ISO-9660 drivers and assign them logical drive letters 'Y' and 'Z' and specify that they should communicate with physical device 'A' (ICDCDROM.BOS). The logical IDs can be any letter from 'C' to 'Z' as long as they don't conflict with other CD-ROM, hard drive, or RAM disk drive letters.

MetaDOS also has the ability to run other programs at boot time much like the AUTO folder does. All that's needed to have MetaDOS run a program is to add the path and filename to the end of the CONFIG.SYS file. By using MetaDOS to run these programs, you don't have to keep them all in one folder, and you can easily specify the order in which they run.

Once the CONFIG.SYS file has been set up properly and the computer is rebooted, drives Y: and Z: will be available. To use them from the Desktop, icons will have to be installed with the Desktop's 'Install Devices...' function.

The Y: drive should be used when a High-Sierra CD-ROM disc is in the drive, and the Z: drive should be used when an ISO-9660 CD-ROM disc is in the drive.

Note that the ICDCDROM.BOS device driver works ONLY on ACSI (DMA port) devices of ID 0 through 7. To use devices on SCSI ports, use the Atari CDARGEN.BOS driver.

USING CD-ROM DISCS

For the most part, CD-ROM discs can be treated as large write-protected hard drives. There are a few differences, though.

Since CD-ROM discs come in several formats (High-Sierra, ISO-9660, Apple HFS), different drive letters are assigned to each format. Using the sample CONFIG.SYS, drive Y: would be used to access a High-Sierra CD-ROM disc and drive Z: would be used to access an ISO-9660 even though there is only one physical CD-ROM drive connected. Apple HFS CD-ROM discs are used almost exclusively on the Macintosh and are not supported by the included drivers. Most IBM PC and Commodore-Amiga and many Macintosh CD-ROM discs are in High-Sierra or ISO-9660 format and can be used with the included software. The format of a CD-ROM disc is usually printed on the disc and packaging.

It is important to remember that although CD-ROM discs designed for other computer systems can be read on the Atari, any programs on those CD-ROM discs can not be run unless they were written specifically for the Atari. Some CD-ROM disc manufacturers compress or encode the data on the CD-ROM disc making the data unusable to any program other than the one supplied on the CD-ROM disc, which won't work on the Atari (unless it was written for the Atari).

>understand the Posix/Unix calls, you're Ok. But yes, some sort of
>documentation would be great. I was thinking of doing something in 1st
>Guide (hypertext).

Hmm but I do have some of the manpages for the mintlibs (the ones in man3, like fopen) and for the lowlevel mintkernel calls (in man2). But the files are old (like for mint 0.96 at the newest) They don't reflect the changes for versions higher than that. 1st Guide is nice, but man pages will do too with that new program manview. The only problem with manview is that I can only have 255 manpages per dir due to limitations of the tos -fs

Erlend.

Well if you need software like that and another Called Xwing, I do sugest you buy a PC clone, none if the type of software will ever be ported to the Atari Computer platform..

If fact I don't think there is any Games software being writen for the Atari at all, Even the chap that did a monthly Catalogue on GEnie had droped it because of no new software.....

From what I have seen the Falcon is a dead loss, not enough sold, so theres no Doom or Xwing for that...

Time I think to get a Real Computer...!!!!

From: wells_s@kosmos.wcc.govt.nz
Message-ID: <2lr05o$h1c@golem.wcc.govt.nz>
Source record: 191125

] One quick Geneva question: If I use geneva with Teradesk, will I only
] be able to launch one application from Teradesk as ST Format implies?
] I haven't been able to find any other reviews of Geneva...

Running software from TeraDesk will put all other applications 'to sleep'
and make whatever is run single-tasking. You can however hit a couple
of buttons and run the program straight from Geneva itself. Neo-Desk
3.03 and better will talk to Geneva and run the programs in multi-task
mode! (Although 3.03 doesn't do it very well, but it's not supposed to,
that's what v3.04 is for! :)

] Also, is Geneva compatible with NVDI? That'd be cool... PowerDOS as
] the DOS, Geneva as the AES, NVDI as the VDI, NeoDesk as the desktop...
] Where'd TOS go? *grin*

Sounds nice to me.... :) What difference does Power-DOS actually make?
Last time I tried it it slowed down benchmark results quite a bit!

NVDI works fine with Geneva.

] And are there any plans for the cart-based version of Geneva that Dan
] talked about?

Tell me more!

] PS: I just got AtariWorks/SpeedoGDOS. AW is version 1.2... It seems
] rather incompatible with NVDI/TurboST. Also, the install programs
] were BOTH incompatible with Selectric (v1.10e)! And the disks all had

Turbo-ST is incompatible with just about everything!

Selectric hooks into some wierd bits of the system, I have noticed things
go wrong with it running!

4822. Stalker\Harlequin clipboard HELP

Newsgroup: comp.sys.atari.st

>But no :-(

Which version of 'GEMAR' are you using with your Falcon, Erling?
I recall that GEMAR v2.01 addresses a minor bug with Falcon SCSI
code, perhaps this is relevant to the problems you have encountered.
I have never tried an Exabyte exb-8200 video-8 streamer nor do I
have a Falcon, but I hope this suggestion to try v2.01 is of some
small help.

Best Regards,
Brian

4826. Trying to set up cross-compiler for MiNT, what about Gas-1.38???

Newsgroup: comp.sys.atari.st
Date: 1994-03-12 01:08:25 UTC
From: mmiller@nyx10.cs.du.edu
Message-ID: <1994Mar12.010825.18400@mnemosyne.cs.du.edu>
Source record: 191131

I've been trying to set up a cross-compiler version of GCC ver. 2.5.8 on the Unix system here. It seems I have all the necessary elements except Gas-1.38. I got the Gas package from atari.archive, and it says to get the Gas-1.38 distribution, and apply the supplied patches to it. I went to prep.ai.mit.edu, and all they have is Gas-2.2, nothing earlier. Where can I find the original Gas-1.38 distribution so I can complete my cross-compiler system?

Thanks,

---Mark

I never said that the Falcon is crap. I stated that Multitos is crapped
compared to System 7. Others would say vice versa and is ones opinion. It's
alright to say that System 7 is crapp and harp on one when someone saids that
multitos is crap.

Your english in that post seemed perfectly fine to me. In fact, I've seen worse posts from native English speakers! <g> Actually, I would be happy for English docs written as well as your post. Anything is better than GER2ENG's output! <hehe> It does a good job of translating literally, but it leaves the words jumbled up. Instead of saying something like: The serial port can have speeds up ot 19200, it might say: The serial port 19200 can have speed. Even broken English is usually better than this.

I don't think anybody is asking you to hire a professional translator for your docs (although it would be nice <g>), just to provide SOMETHING that we can read to allow us to utilize the program to its fullest potential like the German users can.

I always heard it was Spanish. Anyway, suffice it to say that English is the
SECOND most spoken language (it's a Trivial Pursuit (tm) question!) although it
might be (and probably is) the most widely known.

I don't have an external disk for my Falcon (yet, I have one on order), but
I had a simmilar problem with my Mega ST. At first the drive hardly worked at
all. I nearly lost all the files I had on the HD (I'd been using it with a 1040)
because the drive made mistakes in writing FATs and directories.

The disk worked correctly with 1040 ST. After a LOT of trouble I found out
that using a shorter connecting cable practically removed the trouble.
I only occasionaly (i.e. once every few months) had any more trouble.
Then I changed the disk (it was a megafile 20) for a megafile 60, and
the problem went away completely. I guess there was some mismatch between
the characteristics of the drive and of the Mega.

So, try using a shorter connecting cable.

I think, you should check your TMPDIR or TRASHDIR environment. This shows to a
non existing path. Therefore GEMINI can't write it's temporary config.

Hi all,
when Speedo-GDOS first came out it was mentioned that
windoze true-type fonts could be used with it. Now I have looked
in the manual, and I can not find a way of getting the outline.acc
to recognise any PC fonts that I try and install. If I remember correctly
when I tried it last it asked for something like 140Mb of memory for a misc
buffer. Please help, as I have a friend with a CD full of true-type fonts

Thanx

Leave pins 41-44 unconnected.

>- it seems that tbhe 3.1/2" hd needs 12v voltage, the 2.1/2 needed only
> 5v. where shall i get the 12v i need?

I use an external 5 & 12 volt power supply for my 3.5 in. IDE hard drive.

> is the falcon's 12v suply strong enough to give this 12v?

NO!

You will also need a cable adapter. The 44 and 40 way connectors have
different pitch.

4849. How di I download stuff from a Unix Box to my ST via modem?

Newsgroup: comp.sys.atari.st
Date: 1994-03-12 14:06:03 UTC
From: vctec@westminster.ac.uk
Message-ID: <CMK1u4.LMw@westminster.ac.uk>
Source record: 191155
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Dear Friends,

Just got a modem, and have been dabbling with the various Comms programs from Atari Archive.

So far, I quite like Flash II (the crippleware version) and Connect (Another crippled). Haven't tried Storm yet, but will do, and can't get Fizzy to work.

Oh well, never mind, I'll figure them out sometime.

In your opinion, which is the best comms package, and why? I know this is an old question which has been asked millions of times, so please, send your messages to me and not on the net. I don't want to create any flame wars.

I can login to college and bulletin boards via modem using Flash and Connect (Connect sometimes brings up garbled stuff on the screen instead of text....anyone know why?), but how do I download direct to my hard disk at home using my modem....This is killing me...I just can't figure it out.

Say, I've got stelm.lzh in my home directory at college....how do I get it onto my hard disk at home?

I have MINIX on my system....and the terminal program on that is quite good for my needs....so far.... Now MINIX has Kermit, but the Docs with Minix are not very goos. Do anyone know how to use Kermit from within Minix? I've nearly got there, but nothing ever seems to be downloaded.....always get a time out error.

So anyone use Minix for downloadiung? How do I use Kermit successfully from there?

I await your replies....

Thanks.

Oh, and yes....I'm sure a lot of newcomers would like this info too, so, please

basic response has been: no english docs.

I haven't been able to get lindner tex to work so I guess I upgrade
to CS-TeX 4.x. too bad really, I would like to use a supported tex
system but I have to use what I can get to work.

4854. Falcon030/XBoot III problem solved

Newsgroup: comp.sys.atari.st
Date: 1994-03-12 15:52:15 UTC
From: molin@cxc1.cl.msu.edu
Message-ID: <2lsoff$m1j@cxc1.cl.msu.edu>
Source record: 191160

Some of you may recall a few weeks ago I posted a message asking if anyone new of a work-around for a problem I was having with my Falcon when using XBoot III. To summarize, I have a 14-meg unit w/ TOS 4.04 and what I was experiencing was the loss of the right side of the screen where the column of tool icons was whited out and I could not point to any of them. Pointing to pre-defined sets worked OK, and the end result was that everything seemed to work fine once I actually got to the desktop.

It turned out that my NVRAM settings, when set to boot in 2-color mode, prevented XBoot from working properly some 95+% of the time. (Other people have mentioned having some problems, but in the <20% range.) I temporarily resolved the problem by setting NVRAM to boot in 4 colors, however this slowed down the boot time (ever so slightly, but irritating to me because I _knew_ this didn't have to be the case...) XBoot works fine on this unit in 4-color mode.

Recently, I realized that when XBoot had launched in 2-color mode, I was seeing a white column on the left side of the screen OUTSIDE the XBoot screen, yet in 4 color mode, there is no such margin. It occured to me that I was seeing a multi-scan representation of OVERSCAN mode. Sure enough, I found a program that turns off overscan mode, so I put it in the AUTO folder immediately before XBoot and VOILA! I can now boot in 2 color mode faithfully.

For anyone who is having similar problems, this overscan on/off program(s) can be found on atari.archive, in the Falcon directory.

4855. F030 serial port init problem resolved

Newsgroup: comp.sys.atari.st
Date: 1994-03-12 16:03:00 UTC
From: molin@cxc1.cl.msu.edu
Message-ID: <2lsp3k$m2q@cxc1.cl.msu.edu>
Source record: 191161

Some of you may recall that I posted a message a few weeks back about
having problems with serial port initialization on a new Falcon030.
This machine is a 14-meg unit with TOS 4.04, and other persons with
TOS 4.04 have complained about the same problem. Seems no matter what
I tried, the serial port simply would not input and display anything
coming FROM the modem, however keystrokes sent TO the modem were accepted.
This was the case with every terminal package I tried, including STorm,
STalker, and others I forget the name of.

The solution was found in a package called HSMODA02.LZH, a collection
of new serial port drivers for the Falcon AND ALL OTHER ATARI COMPUTERS.
The program(s) are amazingly configurable, althought I found that the
configurator ONLY worked when I was running Mint/MultiTOS, and STalker
is now reporting increased baud rate options including 38400 (which I
am using now on a 14.4 Supra modem...) 76800, and 153600 bps. I have not
tried the 2 latter settings, however I have seen an improvement in
throughput using ZModem so I'm convinced the fix this program implements
is real.

I wasn't looking for faster serial port settings, so this is frosting on
my cake. The fix that permits me to use my modem without having to reboot
is a godsend!

>Any ideas ? (Mega Ste, 2 Mb, TOS 2.06, 105 Mb internal HD)

I found that the CPX, when used on my Falcon, yields the same results
you mention here, yet when the SAME CPX was copied to my 520STfm it
displayed English text.

Go figure.

>It does the same thing when I bood off the original floppy.
>Does anybody know why this is happening?

Since you don't give many details about your setup, I can only
speculate: As you say it used to work, but stopped working now,
I'd suspect that you have installed something in the AUTO folder,
or some MTOS incompatible accessory in the meantime. Try renaming
all programs in the AUTO folder to *.PRX instead of *.PRG (but
leave MINT.PRG unchanged, of course ;-), and all desk
accessories to *.ACX to *.ACC, then check if the system comes up
clean again. If so, activate the accessories and AUTO goodies
by renaming them back to their original names, one by one.
Start with the prime suspects, the things you installed
after you stopped using MultiTOS.
If the error persists after inactivating all accessories and AUTO
prgs, rename the DESKTOP.INF and/or NEWDESK.INF files and see if
that fixes the problem. You migh also want to check your mint.cnf
and gem.cnf files. As a last resort, you could re-install
MultiTOS, of course, and see if things work again then.

>
>I think it was written in Lisp.

Right, the origanal version is written in Lisp but, there is a BASIC version. It can be found in the book _Big_Computer_Games_ from Creative Computing on page 20. It is three pages long and very simplistic. The following is a short blurb from the book.

"Eliza was origanally written by Joseph Weizenbaum in LISP at MIT. The first version in Basic was written by Jeff Shrager in 1973 and converted to MITS 8K Basic (later to become Microsoft Basic) by Steve North in 1977. It originally appeared in _Creative_Computing_, July/August 1977."

I hear an interesting story about Eliza. After Joseph wrote it, his secretary asked if she could use his office while he went to lunch. He was not able to get back into his office for the rest of the day because she would not let him in. Shortly thereafter, he turned against the use of AI. Don't know if this is true though.

> from France for the Falcon in development, though.

It _is_ possible to do a game such as Wolfenstein 3D/Doom for the _Falcon_, but it is impossible to do it on an ST. The ST is to slow to be able to generate 4-plane texturemaps n realtime, with a decent frame-rate. As everybody know, the STE has a BLiTTER-chip, and if you use it right (together with a _fast_ polyrout), you can do a game such as Wolfenstein 3D. But as soon as you want to have some good 4-plane texturemaps in your game, the ST/STE won't have power enough... It's sad, but true!

Message-ID: <199403121753.MAA25152@beauty.magnus.acs.ohio-state.edu>
Source record: 191167

So what is the best option for a slip connection on the Atari? I have KA9Q and pe1hcl as well as the stuff from tu-wien. My problem is that my local server feeds me a new IP number every time I call in, this makes it a pain to use KA9Q. I have a Falcon and am looking at getting the accelerator so a GEM implementation would be prefered.

Any ideas? Anyone porting XMosaic?

From: cs93294@assn030.cs.ualberta.ca
Message-ID: <2lt02p$bcj@scapa.cs.ualberta.ca>
Source record: 191168

Well, the subject says it all. Ishar 2 freezes on me a lot. I own a Falcon with no internal HD, (external SCSI), and a VGA monitor. I also have tos 4.04. Could this be the reason it is freezing on me (the tos 4.04?)? Perhaps they programmed this game on a TOS 4.01 or 4.02 machine. I remember someone else posting a message about this same problem not too long ago, and I am wondering what kinds of solutions I can try! Ishar 2 is a great game but it is hard to get anywhere on a RPG if it keeps freezing on you.

4863. WingLord update

Newsgroup: comp.sys.atari.st
Date: 1994-03-12 18:40:01 UTC
From: vicb@clark.edu
Message-ID: <2lt2a1$3mc@clark.edu>
Source record: 191170

Greetings,

Just wanted to let anyone know who might care that a slightly updated version of the WingLord demo is up on a.a.u.e. (atari/Games/winglord.lzh)

There are a couple of minor glitches fixed, and it will now work on TOS 2.0x machines properly (it worked before but locked up on exit.) This was the only compatability problem that I have heard about, and it does also work fine on Falcon and TT machines.

In case anyone is wondering, WingLord is an action game reminiscent of Joust, but with a shoot-em-up element and a few other differences.

Thanks--

Victor Bruhn
vicb@clark.edu

The problem here is that it only happens to the external drive, the
internal IDE is fine.

I also think my dealer will fix it as I've had to open thecase to fit the
FP U and memory upgrade.

4867. Looking For Kermit

Newsgroup: comp.sys.atari.st
Date: 1994-03-12 19:31:49 UTC
From: astre@halfog.asrc.albany.edu
Message-ID: <9403121931.AA04579@halfog.asrc.albany.edu>
Source record: 191174

Hi! I'm looking for a Kermit which can use long/extended packets,
has a GEM interface, and is compatible with >640x400 screen modes.

I've tried: Uniterm - the best so far, but it doesn't like the big screen,
CKermit5A189 - command line, ugh,
GEM Kermit - old program by B. Nebel from '86, doesn't do
long/extended packets,
Kermit.Arc - from A.A, haven't tried it, but from the docs
it looks like an old CLI implementation.

I get my net access via a site which only passes 7-bits (or so I have
deduced), so I can't use something nice like ZModem. I'm using GEMulator
in 800x600x2 mode. (If you'd be interested in info on GEMulator, either
via c.s.a.s. or email, let me know.)

My access to this mailing list is erratic (via the digest), so please
respond via email. Thanks for your help.

Jeff

You must set the enironment variable TMPDIR in profile.mup or
$HOME\profile.mup, e.g. export TMPDIR="f:\tmp\". Make sure that
the TMPDIR path exists.

4874. STXformer cable?

Newsgroup: comp.sys.atari.st
Date: 1994-03-13 01:18:36 UTC
From: lancer@wpi.WPI.EDU
Message-ID: <2ltplc$m33@bigboote.WPI.EDU>
Source record: 191181

Does anyone know the pinout of the cable mentioned in the STXformer
documentation which allows you to connect 8-bit peripherals to the
ST's parallel port?

I'd like to build the cable but don't know how...

.s.

If we speak raw numbers around the globe that would be correct. i.e.
Mandarin.

>
>But there is no *Chinese* language.. It is Mandarin, Cantonese and a few other
>dialects..

Mandarin is the OFFICIAL Chinese language and by saying Chinese is implying
Mandarin, and it is not another dialect :) like Switzer-Dutsch is to
German...*g*

If you use one of the auto folder speed-setting programs, your actual bootup (before the accessories are loaded) will also be performed with the CPU in fast mode. I have the control panel load as well, but also use an auto folder speed-setter. This shaves about 2 seconds off my boot time (hey, probably 15 minutes a year!).

You might want to check out the Ste/Mega directory on atari.archive.umich.edu. I have put some stuff in there that was previously misfiled.

> I run a 14.4k modem on serial 2 as well. Are you using the defaults

> how should they be set (the german was a little more untraslatable
> in the program (not docs) than I could deal with)...

When I tried to use modem 2 at 38400 (with the latest Connect and HSmoda02), text worked fine but any binary files I downloaded would give "bad CRC" errors when I decompressed them (they downloaded without complaint). Do you have such problems with binary .zip, .lzh, etc. files? If not, what line speed are you using? What terminal program? My understanding of the port labeling on the MegaSTE is: modem1 = regular ST modem port, modem2 = fast modem port, serial 1 = another fast serial, same as the LAN port. Which one do you mean by "serial 2"?

Oh, there should be a BOAST translation of the HSMODA02 docs soon (I know there is a partial translation included, but a complete one will give the information about the setter program, which I am curious about as well).

> Absolutely. Besides, it's nice having MiNT loaded, with minix partitions,
> and Warp9 - get some serious speeds going. And Geneva works quite
> well on it too. I kinda feel like a mini-TT, ya know? ;-)

I have yet to play with MiNT, though I can feel it coming in the near future. If you like Warp9, you'd love NVDI. All GEM stuff is MUCH faster than with Warp9, and I cannot tell a difference with textual stuff (benchmarks say Warp9 is somewhat faster for text, but not by much). Also, the built in GDOS is great! I never used GDOS before, because it was so slow and clunky. The NVDI GDOS is great, very fast and easy to use. It allows you to replace the system font with a GDOS font (cleaner than using the alternate font loading mechanisms that come with Warp9 and Neodesk).

4877. Replacing internal drive: advice wanted

Newsgroup: comp.sys.atari.st
Date: 1994-03-13 02:37:13 UTC
From: winnipg@sys6626.bison.mb.ca
Message-ID: <qgu4ic7w165w@sys6626.bison.mb.ca>
Source record: 191184

I need to replace my internal drive with another 720k brand. What should I get? Teac is mentioned alot. Is it 100% compatible? Will it work with cache programs like acache?

The drive I have now- Chinon FZ-354 doesn't recognize a disk change unless the disk is write-protected. Any way to fix this? Anyone have the same drive?

I had the media change pin(2) and the write protect pin(28) hooked up and that made the comp recognize any disk put in but it created a new problem because 90% of the time it thought all disks were write protected and therefore copying/deleting files was a no-go.

Geneva is a mutitasking AES replacement for ST and TT Ataris. It is very
useful, fun, and works great. You can switch between programs, have
unlimited DAs, get 3D windows, etc.

If you want, I could get you the press release.

>drive as much video bandwidth, etc...

Come now Chris, I've seen better from you....

The fact that the slow 68k is the only familiar Moto. chip in the
machine does _not_ imply that it would necessarily be the main processor.
Just because the MacIIfx had a 6502 in it as a serial controller does not mean
they used it instead of the '030 as the main CPU. The determining factor of
the speed of a Jaguar-used-as-a-computer would be a) what the OS was written
to run on, and b) what the application was written to run on. Heck, even if
the OS were written to run on the 68k, as long as the application was written
to run on the RISC, the performance shouldn't be too bad (as long as "system
routines" (code run on the 68k) isn't the bulk of the code). However, the
completely different architecture of the Jag would necessitate rewriting most
of TOS anyway, and replacing the 68k assembler with a RISC assembler should be
peanuts compared to adapting TOS to run on the new bus/chips/etc.

It sounds like all the 68k will be used for is as a glorified task
scheduler, and maybe process loader/terminator. Or perhaps just I/O. You can
almost guarantee that no business that plans to be sucessful will run the main
part of its code on the 68k instead of the other processors.

I don't understand your problem, once you have installed TeX
(3.1415 2.51) with INSTALL.PRG you wont need the docs, it behaves
like a normal TeX.

There are some things about setting up TeX without HD which are
well, not really important. There is a table about the memory
configuration in TeX but I think this is in English!

The only importand part is about long filenames using MinixFS.

The old (pre 2.5) version has some information about the printerdriver
options which is moved to MULTIDVI.LZH. I haven't read them because
i'm using DVI_210. (Yes, the DVI docs are in german:-)

You may need some information about the TeX-shell, about setting up
printers etc. Feel free to mail me and i'll give you a short translation.

4893. Monochrome Monitor Tilt/Swivel base

Newsgroup: comp.sys.atari.st
Date: 1994-03-13 14:44:40 UTC
From: pietrzak@sparc55.cs.uiuc.edu
Message-ID: <CMLyAH.21u@sparc0a.cs.uiuc.edu>
Source record: 191200

I was browsing through the 3rd floor in Mendelson Electronics yesterday, and came upon some old NCR monitor tilt/swivel bases "for standard mono display" going for $10.00. I had always wanted such an item for my SM124, so I purchased it, figuring that I could probably mess with it to make it stick to the bottom of my monitor.

Well, I just took it out of the box a few minutes ago, and found that it matches the bottom of the SM124 *perfectly*. There are even a pair of plastic locking hooks that fit precisely into some of the air vents in the bottom, making the base hold fast to it. It would appear that however Atari had the SM124 produced, it was created precisely as what NCR thought of as a standard monochrome display.

So, anyway, other than the fact that it is an off-white rather than gray color, there's a tilt-swivel base on my monitor that looks like it's always been there. (It gives 20 degrees of tilt and an amazing 180 degrees of rotation...) So, if you can find them, you can probably use monitor add-ons which work on "standard monochrome monitors", at least from NCR.

(Sorry if everybody already knew this. It's news to me.)

Information:

NCR
Tilt and Swivel Base for standard mono display

Mendelson Electronics Co., Inc
340 E. First Street
Dayton, Ohio 45402

For more info, my address is pietrzak@cs.uiuc.edu

As I don't read this newsgroup all that often, e-mail is a more likely way to get in touch with me than postings.

Thanks

John

Mickey> mean by "serial 2"?

I think you've gotten a bit confused here, Mickey... The MSTE has
serial ports:
Modem1 - MFP controlled, just like the old ST ports, 19200 max
Modem2 - braindead, no RTS/CTS lines, DON'T USE IT!
Serial2 - SCC controlled, fully configured, USE IT!

That's right... The MSTE has NO serial1! Serial1 is only on TTs...
I always use Serial2 with HSMODA02 and everything works fine. The
only trouble comes when you use the LAN port which is wired to the
same SCC chip as the Serial2 port, rendering it useless... Also,
since it sits in the VME slot, it's useless when you have a VME card
installed unless it has a passthrough for Serial2... Anyone know if
you can just wire the port out around the VME card and go on using it?

Mickey> Oh, there should be a BOAST translation of the HSMODA02 docs
Mickey> soon (I know there is a partial translation included, but a
Mickey> complete one will give the information about the setter
Mickey> program, which I am curious about as well).

You got it! It's in the works...

.s.

> cache programs like acache?

If you can find a TEAC 720k unit, I hear these are prefered. See the file
ibmfloppy.lzh (or something similar) on atari.archive.umich.edu for details.

> The drive I have now- Chinon FZ-354 doesn't recognize a disk change
> unless the disk is write-protected. Any way to fix this? Anyone have the
> same drive?

There is a program called fmc on atari.archive that claims to fix this.
Also, I seem to remember that Universal Item Selector patches this problem
(but perhaps only for UISIII, not all programs?!?).

Elm was recently uploaded to atari.archive.umich.edu. I seem to remember
that there was both TOS and MiNT versions included.

> advance!!

My understanding is that you would need an AJAX floppy controller chip and a drive. I believe you also have to set one jumper on the motherboard. If you call STeve's Atari Sales they should be able to sell you a kit to do it (not sure about the price, sorry).

STeve's:

Order Line: 1-800-487-7753
Regular: 1-916-661-3328

Oh, if it was shipped with 2.05 and a 720k drive, it was an early model, not] one of the last ones :-). I believe a majority of them were the newer 2.06 w/HD floppy units. I do not intend to upgrade my floppy (mine is of similar vintage) because I have heard that game compatibility suffers (some copy protection techniques don't like the HD floppy drive).

Not yet...

We were writing '525', a program to convert avr, snd, au, wav, dvsm and raw
to any of these formats some months ago. It's a nice prg. with GEM interface.

Now we really would like to make '727' (or something like that). So if
anybody could send us information about the iff format, we would include
that into the next release.

ICD also now sells there Tape BackUp software, it used to be bundle, but I think it about $99us, but I could be wrong....

They have been doing Tape BackUp for many years, there Tape BackUp software does a very very Fast File copy, from Partition to Partition....

It probably does not copy the file but changes the Fat info,??
is this possible....??

ATIN moved from Leiden to Valkenburg, a small village near Leiden.
In Schiedam (near to Rotterdam) there's another Atari specialised shop,
called MABN. AFAIK the Atari specialised shops in Amsterdam have quit.

Here is your chance to win an Atari Jaguar!

The Atari ST Users Group of Winnipeg is holding a Jaguar raffle to raise funds for various club improvements and to participate in a major computer show. The tickets are $2.00 each and only 2,000 will be sold.

If you would like to enter the raffle please send a money order to:

Atari ST Users Group of Winnipeg
5-390 Carpathia Road
Winnipeg MB R3N 1Y4

The draw will be conducted at our Annual General Meeting on May 12, 1994. The announcement of the winner will be posted to GEnie, Internet, FidoNet,
and AtariNet.

Be sure to send in your order at least 2 weeks before the draw. If the tickets sell out we will return your payment.

Don't miss out on this chance win your own 64 Bit Multimedia Home Entertainment System.

> "acc" from the ACCEXT variable)?

The ACC extension must be in the ACCEXT variable (in GEM.CNF).
You need to change the NEWDESK.INF file. Search for a line that looks
like:
#G 15 FF 000 *.PRG@ @ @
^^ ^^^
(the two emphasized numbers may be different)

Copy this line, change *.PRG to *.ACC, save NEWDESK.INF.
The first number ('15') is a hexadecimal value, representing the icon that
the desktop displays for all files that fit *.PRG, you may want to change
that too for *.ACC.

> Did anyone figure out how to make multiple
> paths for ACCs?

I asked the same question some time ago, but didn't receive any answers. I
assume that it is a bug in AES 4.00, don't know about 4.01 though.

According to "The Mother Tongue", English is (a) the language which is an official language of the largest number of countries; (b) the language which is an official language of countries with the largest total number of people [the debatable exception of Chinese disregarded]; (c) the "milk tongue" of the largest number of people; (d) the most common second (or subsequent) language.

It is of course easy to question this, and point to the whole of Latin America; but sorry, the simple fact is that there isn't a high population country *in* Latin America. And outside of Spain, the Philippines, and Latin America (excluding Brazil which speaks Portuguese and a couple tiny countries which speak English and Dutch), Spanish isn't a major language. English on the other hand has at least two major outposts on every continent *except* South America, where it only has one minor outpost.

I believe you may have misunderstood the early statements about SpeedoGDOS.
Just the opposite is true, actually, that Windoze True-Type fonts _DON'T_
work with SpeedoGDOS. You want Speedo fonts for SpeedoGDOS, such as are
available for use with the DOS (_not_ Windoze) version of WordPerfect.

4924. Atari Works

Newsgroup: comp.sys.atari.st
Date: 1994-03-14 06:24:04 UTC
From: kfason@csn.org
Message-ID: <CMn5s5.8CE@csn.org>
Source record: 191081

I'm having problems with Atari Works. It seems to not like to print. It goes through the routine, then when it says "Printing to: (Printer type) " it does one of the following things.

2 bombs (Bus error)
4 bombs (Illigal Instruction)
shows this at the top where the drop down menus are (and locks up)
" [1] [Unguliges Handle! | Handle = $0040] [Wieter | Tolerierer "

I'm using Works ver 1.2. Speedo is v4.1 Basic default fonts.
I have reinstalled both Speedo and Works.
still has probs.

I have set the cache to 50 for both misc and Caracter, Bitmap is set to 0.
I have also reset them to 100,150,300, and 500K. All of course
rebooting. Still does one of the above, mostly the german(?)

On Printer drivers I have used the Epson LQ-1000 and the Star-(something) 24pin drivers.

my autos are in this order:

NVDI
Speedo
MACCEL34
UIS

I am also using Xboot. And have it change my ASSIGN.SYS and EXTEND.SYS to suit NVDI, STalker, and Works. STalker having the path set to a different path then Speedos fonts (wich is where Speedo and NVDI are).

I am going to combine the STalker fonts and Speedo fonts, thereby killing the need to have Xboot do different ASSIGN.SYS/Extend.SYS files...

thanx! any help is appreciated...

I am planning on purchasing a HP DeskJet 550C (or 560C) in the near future so hopefully its just the drivers and Works, as these drivers worked fine with Word Flair II...

Actually, our thinking is along the lines of a self-addressed stamped envelope (or the equivalent for non-USA registrants) and a disk with your current key file on it. There may be other options, but until we finalize things (and Aaron gets the damn thing done), they'll go unmentioned.

Now, before anyone rushes to send us a disk and SASE... PLEASE WAIT FOR THE RELEASE OF VERSION 2.30! I'll lose things if they show up before we're ready. So please don't start sending things. My computer room is overcluttered as it is.

The low-level docs I saw (ages ago) at a.a were quite out of date, but
I use the Compendium for this now.

The advantage 1st Guide would have over manview (is this a GEM troff,
and does it use Speedo?) is the cross-referencing (hot-linking) would
be better.

>paths for ACCs?

You have to load your newdesk.inf file into a text editor, then
find the line which controls PRG files (quite a short line, it has
.PRG in it). Copy this line, changing PRG to ACC. Save the file,
reboot.

You can leave ACCEXT alone, I haven't tried changing ACCPATH (I don't
think ACCPATH is a variable like PATH, it is really a single
directory).

|> posting misleading info about the Mac.
I haven't seen any misleading info on the Mac. You seem to keep missing one point in particular Macs are very much cheaper in the US than the rest of the world. As a result, a lot of your arguments about power/price ratios don't stand up. Mac software in particular is much more expensive in the UK than it's PC equivelent and a lot more expensive than ST/falcon software - often without much increase in power. There are some very powerful DTP and retouching software that may well impress you even as a seasoned Mac user. It's True! There is also a lot of crap :-)

|> > If I had the cash, I'd buy a Unix workstation. That doesn't mean the Falcon is
|> > crap, just that it fits my budget and does everything I want from it.
|> I never said that the Falcon is crap. I stated that Multitos is crapped
MultiTOS is slow (the AES has been re-written and a newer much quicker version is due out at some point), but has excellent functionality. Internally, it is very similar to Unix and has a lot of nice features sych as symbolic links, loadable filesystems, long filenames with full permissions, shareable program segments, fully pre-emptive with process control and more. The core code ie MiNT is actually quite fast given it's functionality. System 7 is IMHO too slow. 6 was OK but there is a lot of stuff in 7 that really kills the machine.

I've got some problems with the disk magazine ST News. quite a few of the early Issues worked only on the ST (and not STE). I upgraded to an STE about two years ago, but now i can't run the older ST News disks. Does anyone know what compression was used on the data files and would it be possible just to decompress those without going through the ST News program? All I really want are some of the old articles that were on the disks.

Can anyone help?

cheers

A friend of mine, years ago, bought a very cheap XT compatible from Schneider
(the German partner of AMSTRAD, for those of you in the know).
It dead a bit less than a year later, with the message
Pariteten fehler in hauptschpeiher (sorry for sloppy spelling).

Yup, just what it says: parity error in main RAM.

Kobold is payware. Kaktus still exists. I reviewed Kobold 2.5 a few months
ago. It is an excelent piece of software, usefull whenever you need to
copy or move more than say 5-10 files at a time. Even better, it can be
installed to perform all copy/move/delete functions under Gemini 2, Ease
and ***MULTITOS***.

It is worth every pfening of the 110 DEM.

Does anybody know where I can still buy a Mega STE? I have a large amount of ST software and would like to upgrade my current computer (1040ST) to the best in the range of computers that will work with the software,or have I got it wrong in believing the Mega STE is the fastest computer that will work with all my existing software? Basically here is my problem,I have a good computer that does everything I need it to do for me but its getting a little battered.I do not want to spend probably the best part of 1500 pounds to get a new software base for a new computer. So I would like to know which computer in the atari range I can get that will
a) have a better performance than my old one,i.e. faster.
b) run all my old software (or most of it).

If you could tell me the stats of the new computer aswell I could gage myself if the change would really be worth it or not.

Thanks in adavance
Rob Grant.

The last few years a home-made textpacker was used to pack the text, the packer of the old issues is probably ICE.

There's supposed to be a CPX which edits CICONs, which is written by
Scott Sanders (of Compendium fame), but I haven't seen it on the ftp
sites yet.

There is a commercial CICON editor, called Zoom and written by Shift
in Germany.

Shift also sell a commercial resource editor called Interface, which
also edits CICONs.

However Shift are out of business, and the products are now being
handled by another company (with the same people, IIRC).

>is.. What is Geneva?

Geneva is a re-write of the ST's AES (Application Environment System?).
It's primary advantage is that it allows (co-operative?) multitasking
to occur. It is also generally compatible with MultiTOS (minus the
MiNT stuff at this time) - compatible in that it can handle things
that may be written for MTOS (not that you'd want to run them
together). The display is also a more 3-D approach (a la MultiTOS), etc.
I primarily bought a copy for the multitasking capability (and like
the fact that you can terminate and "put to sleep" applications)...

4945. QUES: Problem w/ BJ200e and WordUp

Newsgroup: comp.sys.atari.st
Date: 1994-03-14 15:37:05 UTC
From: bobhays@spss.com
Message-ID: <bobhays-140394093705@haysmac.spss.com>
Source record: 191002

I'm having a small problem with my new BJ200e and WordUp V. 2 (I'll be installing 3.1 soon once my new hard drive arrives).

If I print something, then edit and then print again, the old page is imposed under the new edits. It appears that the print buffer is not getting cleared out between outputs. I'm using the FontGDOS BJ10 driver.

Also, any suggestions for 360x360 fonts would be appreciated.

Email response is fine: bobhays@spss.com, but I also read this conference often.

Thanks and have fun! - Bob

Even a lousy written manual is better than nothing ...

The french atleast seems to have understood that, most french software comes
with english manuals, albeit in very poor english, but so what? It's better
than the french manual for us who don't speak any french at all!

Well, the version of ICD I used allowed you to turn off the boot delay
if I'm not mistaken... Perhaps you need the newer software?

Roger> This I think is the later 6.4.3 Booter.....

I have 6.2.3...

Indeed, there is a WordPerfect for DOS fontpack full of Bitstream
Speedo fonts, but I haven't been able to find it.

Ask for "Bitstream Speedo" fonts at a PC store. They may be able to
get some for you... Or call Bitstream. They offer like 1000 packages
of just about every font in Speedo format...

The ,,Ungueltiges Handle'' line comes from NVDI. Open Xcontrol, select
NVDI-Konfig., disable the option ,,Fehlermeldungen'' (== bug reports),
and press the button ,,Sichern'' (== save).

Of course this won't solve the bombs.

Hi, all.

Nearly ten years ago, I invested in the Atari 520ST; that is, when it first came out. I used it off and on, not intensively at all since there IS no hard disk for it. So...I tucked it away for the last eight years. (I pretty much a UNIX/PC developer.)

But...Last night I pulled it out and set it up. Turned it on. It still works. I was able to the softwares I bought for it long time ago.

I like it. I figure that I want to write a simple vector based game using 68K assembly, making something out of this Atari before I give it away or something. (I hate Intel assembly language, even though, I THINK, it powerful.)

So...Would you please point me to FTP sites that have technical info. on the Atari ST 520, e.g., where is the starting address of the graphics buffer, etc. I need to know if there is a public domain serial utility that lets me connect to my PC serially to transfer Atari files and store on my PC hard disk. Is there a good public domain or shareware 68K assembler around?

Many thanks.

Sang.

I find it irritating as well, and have suggested that they make it a
configurable option in future releases. At this point, I know of no way
to actually get rid of it. Thus, if I am in a hurry, I whack the space
bar (this aborts the pause).

I'm not sure if the original request was for PD/Shareware FAX stuff, but
the commercial product Straight Fax from Toad is reported to be excellent.
I have not actually seen it myself, but I have heard lots of good
recommendations. I wish they would release a demo version (that prints
"Toad" over anything you FAX, or something similar).

Connect is supposed to have FAX support with version 2.50 (not yet released).

Here's a clue: Ever heard of an optimization technique called
interleaving? Also, have you ever checked the relation between the
execution times for the SWAP and DBF instructions?

The above does not indicate that the Falcon has a 32-bit bus.

Chuck,

Not that I have this problem, just a few ideas.

1) Do you have the correct drivers for the SLM605 ?
2) How much memory is left after Calamus is loaded ?
Maybe the 4m ST ram is not enough
3) How about getting rid of unecessary modules or Desk Accessories
4) How does it do running Virtual Memory ?

Hope these ideas help,
Scott

Hmmm, in the Connect docs it is noted that the Serial 2 (you were right about
the name) port is the one to be avoided. I'll give it a try tonight and
see. I presume you are using the HSMODA02 modules drvin.prg, mfp.prg, and
scc.prg (in that order)?

The 'official' environment variable is 'SCRAPDIR' - this works perfectly
in Everest, for me at least.

>You need the clipbrd.cpx

Just the correct environment variable works on my system, Ofir - and the clipboard CPX locks up my machine whenever I load it into Xcontrol. I've never tracked that one down.

> scc.prg (in that order)?

Well, I just checked it out. I get major CRC errors (during downloads) and
dropped characters on Serial 2 at both 57600 and 38400. On Modem 2, I get
no visible errors, but when I try to unpack binaries that I have downloaded,
they report CRC errors. Incidentally, using setter.ttp on scc.prg enabled
57600 on Modem 2 (but did not fix the errors, nor did expanding the buffers).
This is with Connect 2.46, by the way. Bummer.

From: dackerma@magnus.acs.ohio-state.edu
Message-ID: <2m31n6$jhg@charm.magnus.acs.ohio-state.edu>
Source record: 191032

Ok. I've gotten part of the tuw_tcp files to work. I got that off of ftp.tu-clausthal.de. Unfortunately there was no documentation with the software and it causes a stack overflow on my falcon.

So my questions are:

1) Does this software run over the serial line?

2) Anyone have a mail address for the author(s)?

3) Does it run without a ReibelCard Plus?

Ideas and suggestions welcome!!!

Thanks,

Dan Ackerman

RE: Jaguar S-video cable?

It's available. I saw one for sale at Xanth Computers in Bellvue Washington (basically Seattle)... although I went back two days later to buy it and it was gone... sold to a lucky new Jaguar owner. Xanth got them in last week (see datestamp on this message for time frame) so they are shipping although in what quantities I'm not sure.

I really reccomend StraigtFax - it works great on everything from an
ST to a Falcon or TT, and supports many different kinds of input to
fax out (like IMG, GEM, PCX, and FAX), and also works well with MTOS.

It also has a number or printer drivers for different programs,
including allversions of GDOS, and the most popular or Atari WP's and
DTP programs.

It is expensive (about $90 US I think!!) but if you need to fax
something, or recieve faxes, it can't be beat.

>shows this at the top where the drop down menus are (and locks up)
> " [1] [Unguliges Handle! | Handle = $0040] [Wieter | Tolerierer "
<rest deleted>

I have had this happen a few times...

What I have done to avoid it is to open up the file I want to print,
then another file or two, and close those. Possibly I even opened up
a new file, typed something in, then closed that file and print the
other one.

I know this is a little vauge, but it seems to me that if you open up
a file that was previously saved to disk it will not do this. Come to
think of it, it also bombs if you type stuff in a new file and try to
print without saving...

Well, anyway, I know this is not a lot of help, but try some of it out
and see if it works.

Good Luck,

You realize, of course, that this is exactly what the booter is waiting
for? (A keystroke...) ICD's booter allows you to tell the system,
via a single keystroke, which drive to look on for AUTO and .ACCs.
I find this incredibly useful for the rare occasion when I need to
set up my old STfm. I simpy hit the 'J' key and the AUTO/.ACC config
I used to use before getting a Falcon are now still loadable from
my Syquest cart...

It depends on how the application checks for the clipboard. The correct
way is to call scrp_read which will not find an env variable. It just
that Everest check scrp_read and if it fails it tries the env vars as well.

Marco Boldt,

For a complete answer to what GENEVA is pick up the March issues of either CURRENT NOTES magazine or ST INFORMER... both have review. A quic (opps)... a quick answer is -> Geneva is a Multitasking AES replacement written by Dan Wilga. It is very fast compared to MultiTOS and works great on an 8MHz machine. It doesn't take up much memory either... and not only does it allow for multitasking of GEM programs, but it removes many old limitations in GEM as well as adding lots of enhancements. I've been using it for months and I HATE to go back to plain old GEM with the plain old desktop (when compared to NeoDesk).

Probably a case of RTFM.

From the WHATS.NEW file of 6.2.0 .....

W H A T 'S N E W
==========

ICDBOOT v 6.2.0

[....]
There is now a 3 second delay to allow you to read the ICDBOOT "Current
driver settings" configuration data. The delay may be cancelled by
pressing any key. If control-S is pressed execution halts until any
other key is pressed. This allows more time to read the configuration.

Installed as an accessory, it can always be called by pressing
shift-shift-control. The file selector pops up. I use it in the Pure C
environment all the time. I don't think Pure C supports communication of
line numbers, does it? If it does, fill me in!

>Does Edith have an 'auto save setup', so that next time I open the editor I'm
>exactly there where I left it (i.e. including opened documents & cursor
>position)?

Not yet. Does support automatic saving of all other types of configuration
parameters and does support 'project files' which are command line files,
basically. Have been thinking about writing such a project file when the
editress is left by the user, i.e. a file 'default.prj' which is loaded when
the editress is started the next time.

The problem with remembering window positions is that these are not valid
when the next time the editress is run the screen has other dimensions.
Currently, Edith speichers the dimensions and font info separately for all
resolutions (similar to what Gemini 1.99 does).

The demo version will be out somewhere in the first week of April.

Hm!

I thought ATIN was somewhere deep down in the country. What is the exact
address in Amsterdam?

Sorry for my stupid reply. I can't read. But then again I'm sure they
moved from Leiden to sth like Valkenswaard (or a place with a similarly
obscure name).

Timeworks 2 doesn't work on the Falcon. I have a beta which I am testing for GST that works OK on the Falcon but nothing has happened for many monthson it so I suspect it has been shelved. There is no way to make it work unfortunately. It's mainly to do with the way TW2 handles keyboard shortcuts - it upsets the new AES. The Falcon version also works OK with Speedo fonts BTW. Try contacting GST and hurrying them up!

Would you possible be able to UUEncode these and send them up to comp.sources.atari.st or comp.binaries.atari.st? Unfortunately I do not have FTP access but would like to check these things out. I'm not an assembley programmer (yet) but I do collect source code -- generally because that's how I learn to program in any given language, by looking at other people's code. (and assembler code is rther hard to come by...)

Thanks.

Unfortunately there are none quite like Doom or Wolf 3D yet on the ST. In terms, however, of the realtime scaling/rotation aspect of the game, check out the RPG "Legends of Valour" ... it's a bit slow on an 8mhz ST, but is rather nice.

On the Falcon there are no doubt things being done to the same effect. "LEs Hommes et Des Laseurs" (Of Lasers and Men in English) is a Falcon game that is something like Wolf 3D in a fantasy setting.

Well there is some thing like 5 Fax programs that I know of, or may be 6...!!!

1 from USA Strait Fax
3 from Germany Qfax, Qfax Pro, ST-Fax and Coma..
1 From France, Tele Office but this one is a guess...

Some only support Class 2 or 2.0 like Coma..

There is a full working demo of Coma on most Atari FTP sites,
now upto version 1.8, or is it 1.08..Very good....

Mind I am anly recalling all this from memory, and I stand to be corrected..

All,

I use a program called scsiboot on my TT which installs itself onto the boot sector of the floppy in disk a and automatically polls your hard drive and once it spins up it then boots your hard drive. No space bar whack needed.

It worked with my Mega STE also when I use to have one.

It also allows you to use a boot up time delay if your hard drive doesn't report status back.

Leave me an email if it isn't on an FTP site and I can send it to A.A .

5011. Calligrapher: ST Review cover disk

Newsgroup: comp.sys.atari.st
Date: 1994-03-15 13:36:52 UTC
From: rahin@scs.leeds.ac.uk
Message-ID: <rahin.1.000D9DB4@scs.leeds.ac.uk>
Source record: 190918

What is the minimum memory requirement for a usable Calligrapher setup ?

I got Calligrapher on ST Review cover disk and nowhere in the magazine this thing is mentioned. I have a 1040STe, a mono moitor and a 20MB hard disk. After loading the AUTO folder programs, desk accessories and accounting for the disk cache I have about 755KB memory free. Calligrapher, sort of loads, but can not even open a blank document window properly and complains of memory shortage when I attempt to load a doument. The FREERAM desk accessory reports about 1KB free at this stage. If I disable the disk cache and most of the AUTO folder programs and DAs, I get about 850KB free memory. Calligrapher now runs, but can't display onscreen vectorfonts. Could someone with experience shed some light on this ?

BTW, I have a demo of an older version of Calligrapher. This one can do equations & tables, only file saving and printing is disabled. Yet, everything seem to work ok with about 755 KB free memory.

The idea of putting Geneva on a cartridge had been considered at on point, and was even mentioned as a possibility in a couple of public forums. However, Geneva is now too large to put in a cartridge, plus, the extra cost of doing that would probably also rule it out.

Nope. We had hoped to make the end of March deadline that was in our
newsletter, but that is very unlikely to happen at this point. NeoDesk is
too important to us to rush, so we won't release it until it is really ready.
I would guess at this point, barring any further major unforseen problems,
we should be sending them out by the end of April.

The current version of STalker does support the Atari clipboard. I'm not sure what would be causing the disk full error though. We are currently working on minor upgrades to both STeno and STalker. The STeno upgrade will include Atari's clipboard standard.

Currently, we do not have any sort of a release date set for these upgrades, although they probably will be made available as patches.

Try putting the RSC files of the programs you need in one separate directory (e.g. RSCDIR) and add this directory to your AES path (with e.g. gemenv). Maybe this will provide a workaround for the problem (I don't have Geneva and don't normally run Mint (I only have 2.5 Meg ;-)).

Apparently, the latest version of Gemar is 2.20:
ftp.uni-erlangen.de:

./archiver/gemar220.lzh GEM-Archiver v2.20 - run SCSI-streamer (ST/TT)

Note that I just remembered seeing in it in the listing. I haven't used it on
my system.

>
> (oops - this is to myself - duh!) Andy :)

This very easy to do. There's a line-a call to find the position of the fonts
in memory. The fonts are arranged this way: 1 byte for each character, then
the second byte for each character, then the third byte for each character
and so on. So the letter A would be in positions: 65+0*256,65+1*256,65+2*256
and so on. For Low/Medium Rez the characters have 8 bytes each, for high
Rez it has 16 bytes. I don't know about the Falcon but I think they're also
16 bytes. All you've to do is change those bytes.

5021. Falcon & PC-CD-ROM

Newsgroup: comp.sys.atari.st
Date: 1994-03-15 15:52:41 UTC
From: Manson@sterbbs.nl
Message-ID: <22537MSIMLWYIBJUELW@sterbbs.nl>
Source record: 190928

Someone here wondered if it would be possible to use PC-CD-ROMS with
the 486-emulator board for the falcon. Not that I know if that is
possible (and practical), but I was asking myself the same thing.
I dont want to miss out on this CD-ROM thing that is hapening, but I
have a -very- hard time convincing myself that I need to buy a
Intel-based machine for this.
I dont have a falcon (yet), for the above reason, and becouse there
is no 8MB RAM-card for the falcon. 4MB it not enough to multi-task in
any serious way, and 16MB costs a lot of money -and is, although
nice, more than really necessary-.
8MB seems a good compromise. I have understood there are technical
reasons why an 8MB board is not easy to make. But Atari hardware
develloppers have proven to be very resourcefull in solving technical
hardware-problems, so I was wondering if anyone has heard anything
about this.

It's not a bug, it's a feature ;-)

I think it uses the language used in the TOS. I'm not that deep into
programming, but I think there is a variable called *AE_LANG* (Application
Environment Language ?) which might be used.

Developers: do _not_ hit me if I'm wrong *)

5025. HD drive

Newsgroup: comp.sys.atari.st
Date: 1994-03-15 16:33:01 UTC
From: jhogan@uqac.uquebec.ca
Message-ID: <CMpsn2.Ksy@uqac.uquebec.ca>

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello,

I am looking for some information to find out if I can buy an external HD disk drive for my MSTE. First of all, is there such a thing I could use? Secondly, would I have to do anything to my MSTE to use it? Would it be better just to get the upgrade for the internal? Is there any problems with games and other disks while trying to use the on the new internal HD drive?

I think that is all I need to know. If there is anything I left out and I should know, please include that in a response.

Thanks,

Joseph

Sh*t! I use one of the first MegaSTE's shipped in Germany and my Modem2 works great. Of course, I installed HSMODA02 but that's it. CoNnect is set to a DTE-speed of 38K4, with my modem working at 14K4 and I have no problems whatsoever!!!

Actually, Speedo & NVDI don't get on 100%. If you try to access any of the
EdDI extensions which NVDI provides (colour off-screen bitmap support) with
Speedo loaded, then the machine will die a horrible death.

Yes. Extremely annoying, that delay! There should be a way of configuring
it away. 3 bloody seconds! Makes MultiTOS programming a hell :-)

Dear Friends,

My name is Dave Rhodes. In September 1988 my car was reposessed and the bill collectors were hounding me like you wouldn't believe. I was laid off and my unemployment checks had run out. The only escape I had from the pressure of failure was my computer and my modem. I longed to turn my advocation into my vocation.
This January 1989 my family and I went on a ten day cruise to the tropics. I bought a Lincoln Town Car for CASH in Feburary 1989. I am currently building a home on the West Coast of Florida, with a private pool, boat slip, and a beautiful view of the bay from my breakfast room table and patio. I will never have to work again. Today I am rich! I have earned over $400,000.00 (Four Hundred Thousand Dollars) to date and will become a millionaire within 4 or 5 months. Anyone can do the same. This money making program works perfectly every time, 100% of the time. I have NEVER failed to earn $50,000.00 or more whenever I wanted. Best of all you never have to leave home except to go to your mailbox or post office.
In October 1988, I received a letter in the mail telling me how I could earn $50,000 dollars or more whenever I wanted. I was naturally very skeptical and threw the letter on the desk next to my computer. It's funny though, when you are desperate, backed into a corner, your mind does crazy things. I spent a frustating day looking through the want ads for a job with a future. The pickings were sparse at best. That night I tried to unwind by booting up my computer and calling several bulletin boards. I read several of the message posts and than glanced at the letter next to the computer. All at once it came to me, I now had the key to my dreams.
I realized that with the power of the computer I could expand and enhance this money making formula into the most unbelievable cash flow generator that has ever been created. I substituted the computer bulletin boards in place of the post office and electronically did by computer what others were doing 100% by mail. Now only a few letters are mailed manually. Most of the hard work is speedily downloaded to other bulletin boards throughout the world. If you believe that someday you deserve that lucky break that you have waited for all your life, simply follow the easy instructions below. Your dreams will come

true.

Sincerely yours,

Dave Rhodes

INSTRUCTIONS
Follow these instructions EXACTLY, and in 20 to 60 days you will have received well over $50,000.00 cash, all yours. This program has remained successful because of the honesty and integrety of the participants. Please continue its success by carefully adhering to the instructions.

Welcome to the world of Mail Order! This little business is a little different than most mail order houses. Your product is not solid and tangible, but rather a service. You are in the business of developing Mailing lists. Many large corporations are happy to pay big bucks for quality lists.

(The money made from the mailing lists are secondary to the income which is made from people like yourself requesting that they be included in that list.)

1) Immediately mail $1.00 to the first 5 (five) names listed below starting at number 1 through number 5. Send CASH only please (total investment $5.00). Enclose a note with each letter stating: "Please add my name to your mailing list." For other countries the equvielent amount may be sent, e.g. in Hong Kong Send HK$10 as this is the lowest denomination note.

(This is a legitimate service that you are requesting and you are paying $1.00 for this service).

2) Remove the name that appears number 1 on the list. Move the other 9 names up one position. (Number 2 will become number 1 and number 3 will become number 2, etc.) Place your name, address and zip code in the number 10 position.

3) Post the new letter with your name in the number 10 position into 10 (Ten) separate bulletin boards in the message base or to the file section, call the file, MAKE.MONEY.FAST.

4) Within 60 days you will receive over $50,000.00 in CASH. Keep a copy of this file for yourself so that you can use it again and again whenever you need money. As soon as you mail out these letters you are automatically in the mail order business and people are sending you $1.00 to be placed on your mailing list. This list can

than be rented to a list broker that can be found in the Yellow Pages for additional income on a regular basis. The list will become more valuable as it grows in size. This is a service. This is perfectly legal. If you have any doubts, refer to Title 18, Sec. 1302 & 1341 of the postal lottery laws.

NOTE: Make sure you retain EVERY Name and Address sent to you, either on computer or hard copy, but do not discard the names and notes they send you. This is PROOF that you are truely providing a service and should the IRS or some other Government Agency question you, you can provide them with this proof!

Remember as each post is downloaded and the instructions carefully followed, five members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the number five position you will be receiving thousands of dollars in cash.

The following letters were written by participating members in this program.

To Whom It May Concern:

About six months ago I received the enclosed post in letter form. I ignored it. I received about five more of the same letter within the next two weeks. I ignored them also. Of course, I was tempted to follow through and dreamed of making thousands, but I was convinced it was just another gimmick and could not possibly work. I was wrong! About three weeks later I saw this same letter posted on a local bulletin board in Montreal. I liked the idea of giving it a try with my computer. I didn't expect much because I figured, if other people were as skeptical as I, they wouldn't be too quick to part with Five Dollars. But, I buy lottery tickets weekly in my province and have nothing to show for it but ticket stubs. This week I decided to look at this as my weekly lottery purchase. I addressed the envelopes and mailed out one dollar in each as directed. Two weeks went by and I didn't recieve anything in the mail. The fourth week rolled around and I couldn't believe what happened! I can't say I received $50,000, but it was definitely well over $35,000! For the first time in ten years, I got out

of debt. It was great. Of course, it didn't take me long to go through my earnings so I am using this excellent money opportunity once again. Follow the instructions and get ready to enjoy.

Please send a copy of this letter along with the enclosed letter so together we can convince people who are skeptical that it really works!

Good Luck,

Charles Kust
St Agathe Que.

Another letter:
I tried a similar program in which the cost was $5.00 per response. In that one the return was about 3%. Since I did not have a modem I sent out letters regular mail. I created a few mailing labels and printed out all of the labels on pressure sensitive tape. The first mailing that I used the $1.00 dollar per reponse approach I started to get return mail in just over one week! I sent out 200 letters instead of 100 that is required if you use the mail instead of the bulletion boards. Additionally, I included as many friends, relatives, classmates, that I could think of in order to encourage their participation if they happened to recognize my name, so my percentage of gain was higher. I am trying again with 500 letters to see if I surpass the $141,000 of the last time. You just won't believe it until you try.
Best Wishes,
Mark Garner
Dallas Texas

Additional Notes:

This system works equally well if mailed out manually. Mind you it takes more effort to hand address the envelopes and the cost goes up proportionately to cover the postage and envelopes. You must also photo copy the instructions, cross out the name in number one position, write in your name in the number ten slot and change the rest of the numbers accordingly. (It might be neater to use white out or paste over the names.) In order to achieve the same results you must send out the $1.00 dollar to the first five names and then send out another 100 letters with copies of the program enclosed. It has been suggested not to put a return address on the outside of the envelope in order to encourage the recipient to open it. The return will approximate that then received from the posts listed on the bulletin boards.

Hello,

My name is JP Bogers and I'm playing this game for the third time. The first time I played the postal system and it brought me some 17.500 USD. I bought myself a small sailing boat. The second time, using this system, I earned 23.500 USD. I know, a long way from 50.000, but not bad, huh. I bought a new car.

Hello, my name is Steve Prester. As you may have noticed I'm the tenth name on this list, so I do not have a rags-to-riches story to tell here. However, I did make a phone call to the 2nd name on this list, Ernest Goyette. Did he have a rags to riches story to tell? Not exactly, but then I found out that he did not follow the instructions precisely. You see, Ernest lost faith in the program before he had finished following instructions. He only uploaded this file on one BBS, which happens to be operated by Darryl McGinnis, the 3rd name on this list. Ernest told me that he has received $92.00 to date (1/6/90). I realize this is far from the $50,000.00 promised at the first of this file, yet one must keep two things in mind:

1. $92.00 is almost 10 times his initial investment, and it only took about an hour of his time (there's nothing to lose).

2. This program works mathematically on an exponential scale. In other words, for every one BBS that this file is uploaded onto, it should spread to at least ten other BBSs and possibly a whole lot more. So, if Ernest had uploaded his file on all ten BBSs, he should have at least gotten a hundred-fold of what he has, which would be $9200.00. Not bad for a few hours work and a $6.25 investment (including postage).

Finally, I would like to exhort those who become involved in this program to maintain its integrity by being honest. It is the only way that it can possibly pay off. In other words, be sure to enter your name at the bottom of the list and not in one of the top five positions (actually this would be robbing yourself since it is while your name is in the lower positions that it gets multiplied exponentially over hundreds of BBSs). And, of course, send your $1.00 off to the first five names. As I write this I have not made a penny (that's because I have not uploaded this yet), but I thought you might like to hear from someone at the bottom of the list, instead of someone claiming rags-to-riches. I hope such is true, and I'm sure it will be if we all stick with it. The potential is definitely here!

P.S. Call me if you get rich.

Hello,

I'm Kurt Segers from Belgium and was inspired by the money earned
by a friend of mine. He honestly bought himself a sailing boat and
a new sportscar with the profit of this "game". Attracted by this
luxerous moneymaking by simply spending 5 USD enormously teashed
my attention.

Hello,
I am the current #10 on the list, I too am sceptical.
Well what do we all have to lose. It is worth a try
in order to realize some substantial gain. Don't any of you
out there want to upgrade your PC's. I certainly do, but
can't afford to. I hope that this program will make enough
cash in order to buy a super system.
Nua Nicaj

Hey There! Glad your thinking about this seriously because
I am! If all these people are making money then why not be
included with them and get some also? I'm going to be #10 on
this list, and Im uploading it everywhere! If you have the
access :) then follow through, upload it, and see what happens!
Hey, Imagine earning enough to buy a 486? or one of those high
speed modems that cost hundreds of dollars? What about buying
your OWN BBS ? Who wouldnt want to be the Sys-Op of their VERY
OWN board? I know I wouldnt mind :) What do you have to lose
but 5 bucks compared to the hundreds and thousands you CAN make?
I know Im down.. Will you be the very next to EARN some cash?
Talib Khan

Hello, I'm Stephanie Kemach and I am now the tenth person on
this list. I'm trying out this idea in the hopes that it will
pan out, but I've never seen anything like this before. Still,
for a meager investment of $5.00, what do any of us have to lose?
It's worth a try and I'm trying it out now. Good luck to everyone
else who uses this great-looking money-making idea.

This is John Gibbs, call me Gibber. Stephanie is no longer the
last on this list, hopefully I can say the same soon. I agree that
the investment is quite meager, let's see if everybody can benefit
from it. Just a note that Canadians will be happy to accept
American money at par if it is possible. Good luck to all! Bon
Chance, Au Revoir.

Hi this is Jurgen Kreisel, please add my name to the mailing list.
I am the new kid on the block as the last person on this list. I have
always been told that if it sounds to good to be true it probably
is, but what the hay I can blow 5.00 at the video store and get
nothing for my money either. Well here goes nothing.

Hi! I guess I'm now No#10. I have never done anything like this before.

I never even reply to chain letters. I guess I am doing this one coz I
think its actually gonna work. If it doesn't I simply lose a bit of
money (which I probably would have lost at the race meet tommorow
anyways). Time to find out if this thing really works....

Well gee shucks! ...i guess i'm now the 10th dude on this list, as always
u might feel that this is NOT going to work and that people are not gonna
start doing this crap and mailing people money, but hey! ...it's only 5 bucks
US isn't it? ...what've u got to lose eh? i'm certainly gonna try since right
now a bit of money wouldn't be bad while trying to get into a good university
with all the hassles of school!
...seeya lateR! =)
Sanjay Purswani
09/02/94

Hi! I guess I'm No#10 now.I think it is a interesting game for me and u to
have a money making.I have never heard it before,but,at least,i believed it
can let me to upgrade the computer.

Well! This chain letter can give me a hope ,it just cost me $10.
if it is workable,I have many times of this $10.So try this.
It is hoped that the result will be appeared as fast as possible.

Now, I am No.#10.!!!!! I think this chain letter
investment is quite interesting......and worthy...
So..I try it now.....and It can help anyone to upgrade
his computer only by investment of "US$5.00" or "HK$50.00".
Finally, Anyone see this mail, please join this activity..
and please be honest!!! Don't add your name at the top 5 instead of
the bottom of the mailing list!!!!!!! Furthermore, Please send the
money to the first 5 people!!!!

Kit, 13/2/1994

Do everyone want to try this!? It is quite interesting.
I try it now.

Cindy 14/3/1994

I'm broke, so here goes nothing [and $5 ;)]
Maybe I'll actually get some money. Send the $1US to the first 5 people!!!

Ok, I just got some email that gives a very good hint as to what is happening
with this. It turns out that both the Serial 2 problems and the corrupted
disk files are symptoms of two separate hardware bugs in early MegaSTEs.
Fortunately, they are both fixable :-). I'll post a summary when I get all
the details worked out.

> my Syquest cart...

I do realize this. What I am lamenting is that there does not appear to
be a way to turn the 3 second delay off, for those of us that don't need
this feature, and don't find it necessary to read the configurational
information that the booter throws on the screen every time. IMHO, this
should be a configurable option changable with hdutil.prg (zero seconds for
no wait, one second for those with normal dexterity, etc. :-). I personally
view the bootup process as one that I can safely miss watching, in general.
It is not a big deal, but it would also not be very difficult for ICD to
implement a fix.

Hi there.

I think i might have to tell some of you, thats it doesn't seem to matter
if you use terminators or not on a external harddrive connected to the
Falcon. My external drive works fine with or without the terminators.

Greets
Kim

This is possibly the bug of CoNnect 2.45/2.46 in the internal ZModem.
Go and get an archive called conn246u.lzh and update as soon as
possible.

Modem2 is the reliable port connected to SCC-B.

BTW: Did you receive GSZRZ 4.3? Did you upload it to a.a?

Bye,
Knarf

Two quick questions:
1) Is Geneva available in Germany?
2) How does it compare to Mag!X and MultiTos?

To all of you guys. There is a new version of Gemar called 2.20. This one
will work on the Falcon as well. (have just tested this today).

>Could someone with experience shed some light on this ?

Callighrapher cannot display vector fonts with only 1MB RAM. Load CALSETUP
and disable this option if it is enabled. You may also remove the larger
screen fonts (18 and 24 point) from disk. This should free up a little
memory and will not affect printing as Calligrapher always uses vector
fonts when printing.

Good. This way updates are easy and a programmer doesn't have to cater for
many versions as is the case with TOS. Anyone using Geneva should also
have a hard disk so loading Geneva only takes a few seconds anyway.

I don't know what the current version is, but I have v3.02 which does not use the clipboard. Instead it writes a hidden file to the root dir of C: ignoring all guidelines regarding the clipboard and any environment variables. Other than that it's quite a good program.

I have not been told about any later versions by Compo UK who distribute Gribnif products here.

I have had the printing problem with Atair Crashes also. The only way
I got around it was to use the Star 24 pin driver. One thing I noticed
was that this is only doing 180dpi whilst the ones that kill it (the
epson 24pin and NEC 24 pin) try to do 360 dpi.

It still don't work perfect though: there are a few lines here and there
that seem to have lost their justification - this could be coz I am using
a star driver on my 24(-1) pin NEC.

You would have thought they may have spotted this bug...I did phone them
up (Hisoft) and told them what happened and was told to wait for a
new release. Hmmm...

Line-A does not exist on the Falcon or TT. (the 030 uses Line-A for
it's own purposes, Atari should never have used Line-A as it is
RESERVED by Motorola, how many times do we have to go over this :-)

I don't know offhand of a way to get at the font using legal aes/vdi
calls (doesn't mean there isn't a way, I just don't know it).

The program is something i wrote. Actually it is a cd-rom audio player, but with some
nasty extras to help debug my scsi-code...
The program is not (yet) widely available.

5045. RE: ATARI STILL EXISTS? T

Newsgroup: comp.sys.atari.st
Date: 1994-03-15 18:54:00 UTC
From: Wayne.Barnes@mettav.royle.org
Message-ID: <763791302.0@mettav.royle>
Source record: 190951

Well perhaps not much longer. I am in London and am just now reading
a 4 page advertisement in my paper for the new Mac Power PCs.

Here we go:
MS-DOS / WINDOWS Compatible. (And of course Macware)

60 -66 80 mHz

Basic mem 8Mb

up to 3NuBus slots on 8100/80

Masses of HD options

Display DRAM (6100/60) to DRAM+ 2MbVRAM(exp to 4Mb) (8100/80)

Ethernet and LocalTalk

And of course built in PC exchange/ AppleScript
Quicktime/ Fonts/ GeoPort/ Serial ports/ 16 bit Stereo
and much much more

Existing Mac users can upgrade for 600 (UK)

Prices start here at 1350 (UK) and I'm sure they will
drop.

This looks very very good to me, as a FALCON user I'm seriously
wondering why I bother to waste time with Atari when something like
the Power PC is available. Ahhhh! I see (small print) AV technology
is not actually included but the comms are for starters.
It's not coming out until next year indeed! Well it's here and with
very persuasive advertising. I'm going to have to attend an AV demo
as soon as possible, in order to evaluate its price vs performance
in the recording studio. I have a sinking feeling that I will have
to recommend it to my clients instead of the FALCON.

Additional advice from colleagues is to wait until next year. You
can currently buy chip with loads of CAD support for PCBS etc. Make
your own.

Any comments?

>
> MB.
>
>

Of course it is really easy for the Videl, but it is not possible to have any
resolution that you want, since you have the restriction of memorybus speed
(16 MHz). AFAIK the CPU bus performance is dropping when you increase Video
bandwidth. A special VRAM for Video would be recommended....
What I wanted from ATARI would be just a motherboard. Case, Powersupply, Simm
and grafic-card (ISA or PCI) can be obtained cheaper from other places.
The Keyboard connector should be MEGA/TT-keyboard compatible.
But I don't think that I'll see that day where these things become reality
:(*sniff*

Hi all!

I'm just wondering how long is the usual time lapse between ordering from ICD and the arrival of the goods. I ask this because I sent out an order in early February and have had no reply. Of course, now that I have written this, my order will probably arrive in the next few days, if it hasn't already been delivered.

I don't! See above. "Can be sold" and "as well as" does *not* by any stretch of imagination implies German is a native language in Scandinavia, only that Scandinavians (1/3 according to you) are a potential market for a German program. Give me some credit... Everybody knows people in Scandinavia speak "Scandinavian"... ;o)

> I prefer English documentation.

As a native English speaker I might too, but I'm also fluent in German, very comfortable in Dutch, and get by in French. Anyway, *preferences* had nothing to do with the point I was making. My original post was in response to a statement that English language Ataris were "the norm" which is patently wrong and I just pointed out that fact without attaching any implications.

P.S. Betting is now opened on how many humor-challenged humanoids will misinterpret the "Scandinavian" language bit up there and flame me for it... :-)

In Calamus SL, under the last right pulldown (Settings ??, going from memory now)but it is under the last right pulldown, anyway, inside this pulldown is a selection for virtual memory and If I'm not mistaken you can specify how much to set aside, but not sure, where it gets it is from your hard disk, it will create a folder under the folder that contains the program called VM. This is like caching actually.

Hope this helps,
Scott Gruber

You shouldn't compare Geneva with MagiX or MTOS. Geneva is an AES
replacement that allows co-operative multi-tasking, like MultiGem.
MagiX and MTOS offer pre-emptive multi-tasking.

> Maybe the 4m ST ram is not enough
>3) How about getting rid of unecessary modules or Desk Accessories
>4) How does it do running Virtual Memory ?
>Hope these ideas help,
> Scott

Just to add to this: Have you used either prgflags.prg or
fileinfo.cpx to change the flags of the works program so that it allocates
memory from TTram, and runs in TTram? Not only does this speed things up, but
is a real good thing when you have 16MB to play with....

BTW, for those who doubt, I regularly run works and allocate TTmemory
and have _no_ problems printing from there (this in response to some questions
a couple months ago regarding printing to an ACSI devics from fast memory). I
can't wait to get an upgrade tho ....
Anyone know if they will add "Envelope" to the page types available?

Hope that helps.

Since I am new to the NET, can someone advise me on what I
would require to access SLIP? I am using an Atari (of Course)
with a 130Meg HD, 14.4 Modem and 4 Meg memory.

I understand that this is the better way to access the Net.
Also, I know that I am being picky, but is it possible that
the DOCS could be in English? :-)

Thanks to all.

Well, I just picked up a 520ST last weekend at a flea market. Its got a monochrome monitor and a single sided drive...I am very new to this beast and was looking to get a few questions answered if I could...

First off, what kind of hard drive interface is this onb the back of the PC? Is it a 25 pin SCSI, or is it some ATARI specific standard?

What is a good techie book for this thing? I got no manuals with it, just print master and a couple other Desktop Publishing programs...

How expandable is it? I haven't taken it apart yet to see what its made of inside yet, but maybe I should....I don't know what kind of RAM it uses, etc.... I just scoped a few F^TP sites on here for the ST and plan on checking a couple of em out....

Is this shareware as mentioned in the original post? If so, where can it be obtained? I use ANSIterm from time to time, but it lacks several major things that I miss. It's handling of the numeric and cursor keypads make it unsuitable for calling my school's VAX. I only use it to call some PC BBS's, and that is a rare occasion since I never have time to anymore.

5067. Programming the Falcon: which Cli, C, etc...?

Newsgroup: comp.sys.atari.st
Date: 1994-03-16 09:16:56 UTC
From: jhh@cwi.nl
Message-ID: <CMr349.AwA@cwi.nl>
Source record: 190974

Hi,

I've finally ordered a Falcon (4Mb/65Mb, according to the dealer with sound in/out modifications...). If all goes well I'll have it this weekend. To prepare for this happy occasion, I already downloaded some programs from src.doc.ic.ac.uk, and frankly I was quite overwhelmed by the sheer number of programs to be found there. But I got a little confused too, to be honest. So, here are my questions:

- What's the difference between MiNT and MultiTos?
Should all programs for MiNT work under MultiTos as well (e.g. tcsh). And maybe even more important: do all programs written for TOS work under MultiTOS?
- Which Cli/Shell should I use?
I'm hooked on gulam on the st, and use tcsh at work. Does gulam work on the Falcon? Does it also work under MultiTos? If tcsh for MiNT does not work under MultiTos, is there a similar shell that does?
- C and other languages
So, I'm not a big C fan, but alas I fear I'll have to use it on the Falcon. I specifically want to program the DSP. Which compilers support that (Sozobon C, GNU C, maybe the Modula2 compiler). How hard would it be to adapt the libraries of compilers that do not support it. And where do I get the libraries for MultiTos.

I know, quite a lot of questions. But the FAQ is rather short as far as Falcon information is concerned. Any answers and hints would be welcome.

Doesn't DC Format allow you to update the boot sector only? That's where the trouble lies so maybe it will act as a quick fix? Assuming the disks are all standard 720K ones of course.

>Installed as an accessory, it can always be called by pressing
>shift-shift-control. The file selector pops up. I use it in the Pure C
>environment all the time. I don't think Pure C supports communication of
>line numbers, does it? If it does, fill me in!

No, I don't think it does, but there's a possible workaround... everest is
able to recognize lines of the form "Error <filename>: <linenumber>" or
whatever (user configurable, with 3 variables: file, line, column). When
double-clicking on a line of this format, Everest automatically loads the file
and jumps to the line/column specified, exactly as the PC environment would do.
So the only problem is getting PC to write it's errors/warnings to a file
instead of the screen.
Right now I'm writing a shell for PC that (amongst other things) does exactly
this (i.e. redirect PCC and PLINK output to file).
The major drawback of using external editors or a shell with PC has (for me)
always been the fact that you lose the nifty PC-environment options, like
jumping to lines that contain the error, or using the help-system. The
combination of redirecting PC-output & Everest will not suffer from these
shortcomings however -- especially since Everest also has a special menu-option
that cooperates with the TC_HELP accessory (which was written for Turbo C, but
is equally capable of handling Pure C help-files...).

>>Does Edith have an 'auto save setup', so that next time I open the editor I'm
>>exactly there where I left it (i.e. including opened documents & cursor
>>position)?

>Not yet.

In the meantime I donwloaded the prerelease of Edith, and read that this option
will be available in the commercial version. But then: how much is this gonna
cost? I mean, Everest is shareware (20 DM only) and has all the options needed
to fully cooperate with PC. I'm quite sure Iwon't pay e.g. fl 100+ for an
editor that does not offer the same functionality (and to be honest: I couldn't
care less about the 3-D stuff and other 'fancy' stuff Edith offers -- that's
not what I use an editor for).

>basically. Have been thinking about writing such a project file when the
>editress is left by the user, i.e. a file 'default.prj' which is loaded when
>the editress is started the next time.

Stop thinking and implement it. Absolutely required -- as long as the user has the option to turn this auto-save 'off'.

All in all I think Edith looks decent, but isn't fully grown yet. The pre-release has some quirks I don't really like. Example: when jumping to the end of a line (shift-arrow right), then on e.g. a 75-char wide line (which fits in the window easily), Edith scrolls the window to the right -- which is absolutely unnecessary and *very* annoying.
The multiple-selections feature looks fancy, but I don't see any real practical use for it, and think it's often more confusing than helpful. Push/pop positions is not very comfortable, since you have to remember when you pushed what. I prefer the way e.g. Tempus handles this: "set mark #1" in a menu, and after you've set a mark, you get a menu-option "goto mark #1, line xxx". This is much clearer, provides a kind of feedback (line number) and has the same (or more) functionality as your push/pop mechanism.
And I've been able to screw up the screen once by selecting many blocks, scrolling, etc (didn't try to reproduce it) -- at a certain point some garbage was left (mainly a not-removed cursor) which could only be fixed by scrolling the stuff offscreen.
Small note: when moving the mouse in the window scrollbar, it becomes an inverted arrow (i.e. pointing from left to right instead of right-to-left like the normal arrow). Why? Looks very non-standard and is not functional at all.
The Worplus-like function-key bar at the bottom of the screen should be moveable (and a choice between vertical/horizontal would be very nifty), while the icons on top of the screen might as wel have been left out -- as soon as you have a window open they're unreachable anyhow.

A good product, but, as I said, not fully grown yet. For now I'll stick to Everest, which is the the most comfortable editor I've encountered so far. Very smooth feeling, no unwanted nifty bells 'n whistles, but very functional in all respects. Search and replace that allows you to include the wilcard-match in the *replace* string -- e.g. replace *.txt with *.doc, will replace filename.txt with filename.doc, very good inter-text mark-setting, extensive formating capabilities (e.g. for all .C files: tabwidth=2, wordwrap OFF, linelength=255, autoindent=ON; for all .TXT files: tabwidth=4, wordwrap ON, etc... and so on, for 10 different file-types, all user configurable), etcetera...

From: mortene@stud.unit.no
Message-ID: <2m6ti4$4gl@ugle.unit.no>
Source record: 190982

I'm trying to get hold of some info on the Falcon's graphicsmodes (and the RAW graphicsformats used by the Falcon). Is there a textfile somewhere (on ftp) that I could use? What I'm after is basically something like the Hardware Reference Manual for the Amiga.

(I'm doing a converter on the Amiga to help coders use graphics in their programs, and I've already included all the most common Amiga, SNES and IBM-compatibles graphicformats (like bitplanes, interleaved, chunky, SNES charbased, SNES mode7 +++)).

(Please let me know if I'm in the wrong newsgroup.)

Thanks in advance,
Morten

|>
|> Erling

Hmm - replying to my own article... :-)

I tried with gemar2.20 yesterday.
It sort of works now.

The trouble was the setting of transfer speed. I just can't see how
this could have any effect, though.

Anyway, I sat transfer speed to maximum (1024kb/sec), and I was able
to make a backup.
There were however a few other quirks, but the backup seemed to
be fine. I suppose I'll get it working better if I hand-tune some
of the other parameters.

I was not able to fast-forward the tape, though. Rewind worked
fine, but when I pressed the forward button, the exabyte complained
about "Command not understood" (or whatever the german message was).

Also, it always bombed after completing the backup - but the backup
process went fine. The only trouble was that there was no way
to verify the data written to tape. (I guess this is about when
the program crashes, after writing the last index and rewinding
the tape, and before starting to verify).

I did a small test, backing up ~10 Mb of data, then I restored
it to another partition. Then I compared all the files - and they
were identical.

The troubles I describe might disappear with more
careful configuration - I did not have
time to study all the docs last night.

Erling

|>
Well, actually, that is not true: the line-F calls were reserved by motorola for the floating point stuff, the line-A was designed to be used as some sort of graphics emulator. But nevertheless, the line-A stuff in the atari should not be used, as it is not portable across different resolutions. So: whatever you do, DO IT WITHOUT LINE-A! Use the VDI instead.

Nope, the EdDI extensions still work (on a mono ST, at least). Maybe
you have TOS Compatibility turned on? Turn it off! Live dangerously!

>for GEM, and not a lot else. Any ideas?
>

The easiest GEM material for you to get will be Tim Oren's ProGEM articles, which are in a.a (Programming/progem.arc and Programming/prosrc.arc). It builds up to a little mini-application at the end.

Otherwise, look at Ian Lepore's GEMfast library at a.a (same directory) which is well documented, and has some useful routines.

5081. ST continued production

Newsgroup: comp.sys.atari.st
Date: 1994-03-16 13:32:23 UTC
From: Iain.Laskey@barclays.co.uk
Message-ID: <CMrEy0.BxB@barclays.co.uk>
Source record: 190988

Daryl Still of Atari UK/Europe/whatever has just stated on CIX that Atari have a consignment of new STs about to be delivered but won't be making any more after that. He said that the minimum order was 2000 units and until they had that, they wouldn't do a production run. they will keep the ability to produce though so more may well be made as demand requires.

More interestingly, he stated Atari intend to support STs actively until the end of the millenium.

5082. Any limit on size of Falcon SCSI discs?

Newsgroup: comp.sys.atari.st
Date: 1994-03-16 13:35:59 UTC
From: matija@sirius.ijs.si
Message-ID: <1994Mar16.143559.966@cathy.ijs.si>
Source record: 190989

As I might have mentioned before, I am trying to get an external SCSI disk
for my Falcon. Right now, sizes around 1GB are being mentioned.
However, in passing, a friend of mine mentioned that PCs can only format
SCSI disks of up to 1G - therefore he can get me a 2G drive for a very
reasonable price.

Does the latest AHDI allow me to access disks of 2GB size? To partition
and high-level format them correctly?

If you bought a Falcon with HD in the UK, you get MTOS, Speedo and a bunch of PD
bits like AFM etc. You do not get Works, that is 129.95 GBP from Hisoft. If you
buy a HD free falcon, you get nothing.

If you have the HD model, Atari should in theory send you the stuff in due
course. Better to be sure and mail atari@cix.compulink.co.uk and quotethe serial
number of your machine. They will then send out the stuff.

5086. T2 not working

Newsgroup: comp.sys.atari.st
Date: 1994-03-16 15:16:13 UTC
From: palm_erd@csusys.ctstateu.edu
Message-ID: <1994Mar16.101613.1@csusys.ctstateu.edu>
Source record: 190993

A friend just bought the game Terminator II from a European company. He has an NTSC system, as I do also. He brought it over the other day to try it on my TOS 1.2 system. It would go as far as displaying a screen and playing some music, but we can't get it to play. It just sits there playing the music. Do I need a 50 hz booter program? He says he has one, but it's only good for programs that load from the desktop. T2 boots from disc. Could someone either tell me exactly where I could find a PD or Shareware 50 hz booter program. I don't visit this newsgroup much, so please respond via-Email before he send the game back as a defect.
BTW He has TOS 1.4 with 1 meg, I have 2 megs. Neither work.
Eric

5087. ****VERY IMPORTANT READ THIS !!!****

Newsgroup: comp.sys.atari.st

From: "SANTA KLAUS"
Message-ID: <CMrK2v.8Kx@ireq.hydro.qc.ca>
Source record: 190994

HELLO EVERYBODY, READ THIS PLEASE

Sorry if it's not exactly your favorit subject, and if I'm not
exactly Santa Klaus (but it could be). Just read what is
following. Yesterday, I got something in the News. It was
telling how to earn easy money, fast !! I decided to try
because I'm not that kind who speaks whithout knowing
(and maybe because I want to dream too). What I understood
is that I need to persuade you to do the same. Honestly,
I won't tell you that it works because I don't know, I'm
trying. All what I can say is that I (you) have nothing to
loose but 5 (five) USDollars. What are five dollars ???
Are you sure you looked well around when you bought
your TV, video or computer ? Are you sure you didn't
already loose more than five dollars ? If it doesn't work,
at least I will have tried (and I really think I will refund
my five dollars and my stamps).
Anyway, what is following is what I got in the News. Read
and make your own idea.

****
****

Forward from others,

Dear Friends,

My name is Dave Rhodes. In September 1988 my car was
repossessed and the bill collectors were hounding me like
you wouldn't believe. I was laid off and my unemployment
checks had run out. The only escape I had from the
pressure of failure was my computer and my modem. I
longed to turn my advocation into my vocation.
This January 1989 my family and I went on a ten day
cruise to the tropics. I bought a Lincoln Town Car for
CASH in Feburary 1989. I am currently building a home on
the West Coast of Florida, with a private pool, boat slip,
and a beautiful view of the bay from my breakfast room
table and patio. I will never have to work again. Today I
am rich! I have earned over $400,000.00 (Four Hundred
Thousand Dollars) to date and will become a millionaire
within 4 or 5 months. Anyone can do the same. This money
making program works perfectly every time, 100% of the
time. I have NEVER failed to earn $50,000.00 or more
whenever I wanted. Best of all you never have to leave

home except to go to your mailbox or post office.
In October 1988, I received a letter in the mail telling me how I could earn $50,000 dollars or more whenever I wanted. I was naturally very skeptical and threw the letter on the desk next to my computer. It's funny though, when you are desperate, backed into a corner, your mind does crazy things. I spent a frustating day looking through the want ads for a job with a future. The pickings were sparse at best. That night I tried to unwind by booting up my computer and calling several bulletin boards. I read several of the message posts and than glanced at the letter next to the computer. All at once it came to me, I now had the key to my dreams.
I realized that with the power of the computer I could expand and enhance this money making formula into the most unbelievable cash flow generator that has ever been created. I substituted the computer bulletin boards in place of the post office and electronically did by computer what others were doing 100% by mail. Now only a few letters are mailed manually. Most of the hard work is speedily downloaded to other bulletin boards throughout the world. If you believe that someday you deserve that lucky break that you have waited for all your life, simply follow the easy instructions below. Your dreams will come true.

Sincerely yours,

Dave Rhodes

INSTRUCTIONS
Follow these instructions EXACTLY, and in 20 to 60 days you will have received well over $50,000.00 cash, all yours. This program has remained successful because of the honesty and integrety of the participants. Please continue its success by carefully adhering to the instructions.

Welcome to the world of Mail Order! This little business is a little different than most mail order houses. Your product is not solid and tangible, but rather a service. You are in the business of developing Mailing lists. Many large corporations are happy to pay big bucks for quality lists.

(The money made from the mailing lists are secondary to the income which is made from people like yourself requesting that they be included in that list.)

1) Immediately mail $1.00 to the first 5 (five) names listed below starting at number 1 through number 5. Send CASH only please (total investment $5.00). Enclose a note

with each letter stating: "Please add my name to your mailing list." For other countries the equvielent amount may be sent, e.g. in Hong Kong Send HK$10 as this is the lowest denomination note.

(This is a legitimate service that you are requesting and you are paying $1.00 for this service).

2) Remove the name that appears number 1 on the list. Move the other 9 names up one position. (Number 2 will become number 1 and number 3 will become number 2, etc.) Place your name, address and zip code in the number 10 position.

3) Post the new letter with your name in the number 10 position into 10 (Ten) separate bulletin boards in the message base or to the file section, call the file, MAKE.MONEY.FAST.

4) Within 60 days you will receive over $50,000.00 in CASH. Keep a copy of this file for yourself so that you can use it again and again whenever you need money. As soon as you mail out these letters you are automatically in the mail order business and people are sending you $1.00 to be placed on your mailing list. This list can than be rented to a list broker that can be found in the Yellow Pages for additional income on a regular basis. The list will become more valuable as it grows in size. This is a service. This is perfectly legal. If you have any doubts, refer to Title 18, Sec. 1302 & 1341 of the postal lottery laws.

NOTE: Make sure you retain EVERY Name and Address sent to you, either on computer or hard copy, but do not discard the names and notes they send you. This is PROOF that you are truely providing a service and should the IRS or some other Government Agency question you, you can provide them with this proof!

Remember as each post is downloaded and the instructions carefully followed, five members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the number five position you will be receiving thousands of dollars in cash.

The following letters were written by participating
members in this program.

To Whom It May Concern:

About six months ago I received the enclosed post in
letter form. I ignored it. I received about five more of

the same letter within the next two weeks. I ignored them also. Of course, I was tempted to follow through and dreamed of making thousands, but I was convinced it was just another gimmick and could not possibly work. I was wrong! About three weeks later I saw this same letter posted on a local bulletin board in Montreal. I liked the idea of giving it a try with my computer. I didn't expect much because I figured, if other people were as skeptical as I, they wouldn't be too quick to part with Five Dollars. But, I buy lottery tickets weekly in my province and have nothing to show for it but ticket stubs. This week I decided to look at this as my weekly lottery purchase. I addressed the envelopes and mailed out one dollar in each as directed. Two weeks went by and I didn't recieve anything in the mail. The fourth week rolled around and I couldn't believe what happened! I can't say I received $50,000, but it was definitely well over $35,000! For the first time in ten years, I got out of debt. It was great. Of course, it didn't take me long to go through my earnings so I am using this excellent money opportunity once again. Follow the instructions and get ready to enjoy.

Please send a copy of this letter along with the enclosed letter so together we can convince people who are skeptical that it really works!

Good Luck,

Charles Kust
St Agathe Que.

Another letter:
I tried a similar program in which the cost was $5.00 per response. In that one the return was about 3%. Since I did not have a modem I sent out letters regular mail. I created a few mailing labels and printed out all of the labels on pressure sensitive tape. The first mailing that I used the $1.00 dollar per reponse approach I started to get return mail in just over one week! I sent out 200 letters instead of 100 that is required if you use the mail instead of the bulletion boards. Additionally, I included as many friends, relatives, classmates, that I could think of in order to encourage their participation if they happened to recognize my name, so my percentage of gain was higher. I am trying again with 500 letters to see if I surpass the $141,000 of the last time. You just won't believe it until you try.
Best Wishes,
Mark Garner
Dallas Texas

Additional Notes:

This system works equally well if mailed out manually. Mind you it takes more effort to hand address the envelopes and the cost goes up proportionately to cover the postage and envelopes. You must also photo copy the instructions, cross out the name in number one position, write in your name in the number ten slot and change the rest of the numbers accordingly. (It might be neater to use white out or paste over the names.) In order to achieve the same results you must send out the $1.00 dollar to the first five names and then send out another 100 letters with copies of the program enclosed. It has been suggested not to put a return address on the outside of the envelope in order to encourage the recipient to open it. The return will approximate that then received from the posts listed on the bulletin boards.

Hello, my name is Steve Prester. As you may have noticed I'm the tenth name on this list, so I do not have a rags-to-riches story to tell here. However, I did make a phone call to the 2nd name on this list, Ernest Goyette. Did he have a rags to riches story to tell? Not exactly, but then I found out that he did not follow the instructions precisely. You see, Ernest lost faith in the program before he had finished following instructions. He only uploaded this file on one BBS, which happens to be operated by Darryl McGinnis, the 3rd name on this list. Ernest told me that he has received $92.00 to date (1/6/90). I realize this is far from the $50,000.00 promised at the first of this file, yet one must keep two things in mind:

1. $92.00 is almost 10 times his initial investment, and it only took about an hour of his time (there's nothing to lose).

2. This program works mathematically on an exponential scale. In other words, for every one BBS that this file is uploaded onto, it should spread to at least ten other BBSs and possibly a whole lot more. So, if Ernest had uploaded his file on all ten BBSs, he should have at least gotten a hundred-fold of what he has, which would be $9200.00. Not bad for a few hours work and a $6.25 investment (including postage).

Finally, I would like to exhort those who become involved in this program to maintain its integrity by being honest. It is the only way that it can possibly pay off. In other words, be sure to enter your name at the bottom of the list and not in one of the top five positions (actually this would be robbing yourself since it is while your name is in the lower positions that it gets multiplied

exponentially over hundreds of BBSs). And, of course,
send your $1.00 off to the first five names. As I write
this I have not made a penny (that's because I have not
uploaded this yet), but I thought you might like to hear
from someone at the bottom of the list, instead of someone
claiming rags-to-riches. I hope such is true, and I'm
sure it will be if we all stick with it. The potential is
definitely here!

P.S. Call me if you get rich.

Hello,
I am the current #10 on the list, I too am sceptical.
Well what do we all have to lose. It is worth a try
in order to realize some substantial gain. Don't any of you
out there want to upgrade your PC's. I certainly do, but
can't afford to. I hope that this program will make enough
cash in order to buy a super system.
Nua Nicaj

Hey There! Glad your thinking about this seriously because
I am! If all these people are making money then why not be
included with them and get some also? I'm going to be #10 on
this list, and Im uploading it everywhere! If you have the
access :) then follow through, upload it, and see what happens!
Hey, Imagine earning enough to buy a 486? or one of those high
speed modems that cost hundreds of dollars? What about buying
your OWN BBS ? Who wouldnt want to be the Sys-Op of their VERY
OWN board? I know I wouldnt mind :) What do you have to lose
but 5 bucks compared to the hundreds and thousands you CAN make?
I know Im down.. Will you be the very next to EARN some cash?
Talib Khan

Hello, I'm Stephanie Kemach and I am now the tenth person on
this list. I'm trying out this idea in the hopes that it will
pan out, but I've never seen anything like this before. Still,
for a meager investment of $5.00, what do any of us have to lose?
It's worth a try and I'm trying it out now. Good luck to everyone
else who uses this great-looking money-making idea.

This is John Gibbs, call me Gibber. Stephanie is no longer the
last on this list, hopefully I can say the same soon. I agree that
the investment is quite meager, let's see if everybody can benefit
from it. Just a note that Canadians will be happy to accept
American money at par if it is possible. Good luck to all! Bon
Chance, Au Revoir.

Hi this is Jurgen Kreisel, please add my name to the mailing list.
I am the new kid on the block as the last person on this list. I have
always been told that if it sounds to good to be true it probably
is, but what the hay I can blow 5.00 at the video store and get

nothing for my money either. Well here goes nothing.

Hi! I guess I'm now No#10. I have never done anything like this before.
I never even reply to chain letters. I guess I am doing this one coz I
think its actually gonna work. If it doesn't I simply lose a bit of
money (which I probably would have lost at the race meet tommorow
anyways). Time to find out if this thing really works....

Well gee shucks! ...i guess i'm now the 10th dude on this list, as always
u might feel that this is NOT going to work and that people are not gonna
start doing this crap and mailing people money, but hey! ...it's only 5
bucks
US isn't it? ...what've u got to lose eh? i'm certainly gonna try since
right
now a bit of money wouldn't be bad while trying to get into a good
university
with all the hassles of school!
...seeya lateR! =)
Sanjay Purswani
09/02/94

Hi! I guess I'm No#10 now.I think it is a interesting game for me and u to
have a money making.I have never heard it before,but,at least,i believed it
can let me to upgrade the computer.

Well! This chain letter can give me a hope ,it just cost me $10.
if it is workable,I have many times of this $10.So try this.
It is hoped that the result will be appeared as fast as possible.

Now, I am No.#10.!!!!! I think this chain letter
investment is quite interesting......and worthy...
So..I try it now.....and It can help anyone to upgrade
his computer only by investment of "US$5.00" or "HK$50.00".
Finally, Anyone see this mail, please join this activity..
and please be honest!!! Don't add your name at the top 5 instead of
the bottom of the mailing list!!!!!!! Furthermore, Please send the
money to the first 5 people!!!!

Kit, 13/2/1994

Do everyone want to try this!? It is quite interesting.

I try it now.

Cindy 14/3/1994

****
****

OK, if you decided to try, here are the places where I posted
this letter. I put it only in newsgroups. I think it would be
clever (at least not stupid) to find other places (newsgroups

or BBS). I choosed them because of their high number of
articles, and because they're not connected between one
another ; for example, people who have a PC generally don't
have a Mac..., people interested in Star Trek are not the ones
interested in chess...
I didn't choose BBS because I can't, but if you do, go ahead,
espacially if you live out of the USA (BBS are generally much
younger there than in the US).
Newsgroups I choosed:

comp.sys.ibm.pc.games.action

comp.sys.amiga.games

comp.sys.atari.st

misc.jobs.offered

misc.arts.anime

rec.arts.startrek.misc

rec.games.chess

rec.games.video.nintendo

rec.games.video.sega

comp.sys.mac.games

Good luck (to us).

P.S : Perhaps it wouldn't be stupid to put this in ftp sites.
I think our chance is that the number of logged people is
always increasing (espacially out of the US, I insist).
So long ....

It's not as simple as that, but in general a pre-emptive system allows you
to control process priority. As an example under Geneva, background
operation are likely to take to much power, making foreground operation
VERY slow. Under Mag!x this is not the case.
I'm sure this will be followed by more detailed explanations.

The clipboard scrp_read and scrp_write have been documented since 1985. An application should always enquire using these functions. Why have such as strange option such as drive Z? Why not simply a button called GEM Clipboard? This just adds to the confusion.

In <2m61gh$oll@uqcspe.cs.uq.oz.au>, Marshall (G.M wrote:

> what are the benefits/disadvantages of pre-emptive versus co-operative
> multi-tasking?

Pre-emptive mt:
You can have gcc, groff and TeX running in the background, while you're reading your news or e-mail in the foreground. The operating system decides when to change between tasks, no special action is required from an application. If you're running an 8MHz ST, you will notice that your newsreader acts rather slow and is not very responsive. On a fast TT running MagiX you notice some difference in speed, but not enough to be annoyed.

Co-operative mt:
You can also have several programs running at the same time, but only GEM programs that regularly call the AES. The AES can not force a taskswitch. TOS applications running in a window will not perform any AES calls, and will therefor effectively block any multi-tasking. The same is true for GEM applications wich do not make AES-function calls regularly. The main adantage of co-operative mt is that it's less expensive, in terms off CPU cycles, than pre-emptive mt.

There can be no general conclusion on which type of multi-tasking is better. Your choice should depend on the applications and hardware you're using.

> Also, which of Mtos, Mag!x, Geneva uses which (if any) desktop?

Mtos has a built-in desktop, which can easily be replaced. MagiX is distributed with MagXDesk, a very simple desktop. All MagiX features are also supported by Ease. Gemini2 supports MagiX as well as Mtos. Geneva is best used in combination with NeoDesk.

Of course you can use any desktop with Mtos, MagiX or Geneva, but the special features of those systems will not be supported.

I APOLOGIZE

this morning I posted an article that was a chain letter. OK I'm stupid, I'm an idiot: I really didn't know it was illegal. If I cut the head of the article, it was to receive the flames (I know there are always) at home. But I'm so stupid that I didn't think there would be the name of my organization and that I would cause trouble to them. I apologize again.
So now that you have my E-mail address, you can send your flames to me (not to my administrator). I will read all of them because I'm guilty, but I won't answer. I wouldn't have anything else to tell but apologize. Excuse me for the trouble I caused.

All excellent questions. Perhaps the main one should be: Which MegaSTE serial port is braindead and useless, if any? This thread has had reports of folks using both Modem2 and Serial2 with no problems, but not at the same time :-).

As this is generating so much interest, here is the email I received that seems to explain my problems with both Modem2 and Serial2. It seems that there are two separate hardware bugs that can account for errors on Modem2 and Serial2, respectively. So, perhaps some folks have one, some have the other, and an unlucky few (me, apparently :-) have both.

Big thanks to Waldi for emailing this to me!

----being included message----

Here's an extract from a posting to the mint-list, which might explain (part of) the problems you're experiencing, and offer a solution.

Regards,
Waldi (walra%moacs11@nl.net)

Subject: Re: user-written interrupt handlers
From: Juergen Lock <nox@jelal.north.de>
Date: Sat, 12 Mar 94 19:49:22 CET
Message-Id: <9403121849.AA00373@jelal.north.de>

[...]
> But then: What's about the MSTE problems with it?

ok... two kinds of problems: 1. SCC IO (interrupts, access 0xffff8c8x) interferes with disk DMA causing flipped bits on the way to disk and/or SCC (for example receive megabytes of gzip'd news batches without one protocol error and then unbatching finds corrupted files! nearly made

me crazy while porting uucp...) and 2. a bugged PAL (UA03, checksum $5613)
that makes the 2nd SCC port (serial2/`appletalk') lose chars no end.

some people never notice the 1st one, i don't know if there are board
revisions that really don't have it or if it just happens less often
(or maybe the people never run multitasking and rarely have disk and
SCC IO happen at the same time...) a fix (patched GAL) for the 2nd one
is described in fser096* (should be on a.a); the 1st one, at least the
corrupted disk problems can be reduced from (in my case) `happens every
2nd file' to maybe `once every 1000 files' by replacing the Z85C30 SCC
with a Z85230 (both Zilog here, Am85C230A might also help), described
in fser* too. (the extra clock stuff is not essential, original 8MHz
still works.)
[...]

----end included message----

I found fser096b.lzh (I'll stick it on atari.archive.umich.edu, as we don't
seem to have it), and it indeed has a MegaSTE specific blurb to fix the
bugged PAL, UA03.

I intend to replace my SCC chip with one of the ESCC chips mentioned above
(this is an upgrade in addition to a bug fix, as one can then use ESCC.PRG
from HSMODA02 and get better performance). I also intend to get a new UA03
burned to fix Serial2. Finally, I appear to have the GST Shifter problem
(crackling on DMA sound), so I need to get a 1040STE shifter and replace
it too (whew).

Boy, I'm glad I got such a good deal on this machine..... :-).

Note that mine is a very early model, so many MegaSTE owners would probably
not have to go through all this to get everything hunky dory.

Here are my tests for the various bug behaviors:

bad Modem2 - at 38400 or 57600, download several .lzh or .zip files with
Zmodem (either Connect's or gszrz228), and check them with STzip or
lharc for CRC errors. This might also happen at lower baud rates.

bad Serial2 - pump the baud rate up to 38400 or 57600 (Connect and HSMODA02)
and dump some text to the screen. You should lose characters quite
apparently. Also, downloads get continuous CRC retransmit errors.
This might also happen at lower baud rates.

bad GST Shifter - if you have TOS 2.05, there is a program included with
the bug fixer on atari.archive.umich.edu that can induce the mono
wrapping symptom of this problem. If you have TOS 2.06, the mono
wrapping problem is already patched, but you will still hear
crackling on DMA sound output. One test for this that works
consistently for me is to run the Brain Damage demo, and listen for
crackling during the loading of the second disk (when the heartbeat
sound plays for 20-30 seconds). The crackling is also quite
noticeable when using ProtrackerST 1.0 to play .mod files at 50kHz.

In <CMr349.AwA@cwi.nl>, Jaap Henk Hoepman wrote:

> - What's the difference between MiNT and MultiTos?

MTOS consists of two parts:
1. mint.prg, a Gemdos extension, started from the auto folder.
2. gem.sys, a replacement AES, started by mint.prg.

> Should all programs for MiNT work under MultiTos as well

Most of them will, use Miniwin or Toswin to run MiNT/Gemdos applications
in a GEM-window.

> And maybe even more important: do all programs written
> for TOS work under MultiTOS?

No, clean Gemdos (*.TOS, *.TTP) and clean GEM (*.APP, *.PRG, *.GTP)
applications do. Other apps. cause trouble, ranging from garbage on
your screen to system crash.

> - Which Cli/Shell should I use?

The same tcsh/bash that you're using with MiNT.
A nice alternative is Gemini2 (with built-in Mupfel).

Source record: 190856

Hi everybody!

I'm trying to connect a VCR to my 1040STE and display the VRC and STE picture
at the same time and on the same screen. For this purpose I need to synchronize
my STE video output externally.
I read something about the adress $FF820A - it said that bit 0 was for toggeling
sync. mode (internally/externally), bit 1 was supposed to be used to select
50/60 Hz freqency.

Has anyone of you experience with doing this kind of stuff?
Do I need a Genlock interface or something like that?
Which pin of the monitor plug is for external sync.?
Do I need any specific software - are the any programs in the public domain pool?
Does anyone have any circuit diagrams for an interface of the kind I need (that I could
buil myself...)?

Thanks for helping me!

No you can't buy new Atari SM124/144 monitors anymore.

However, a number of people are selling VGA/SVGA monitors adapted
to run in ST Hires mode. eg LadBroke Computing, System Solutions, Silica
Systems. Read a current Atari mag.

Alright, I've had it up to here with the flames German programmers received. Others have pointed out that English is not the only World Language (did anyone count speakers of Chinese or possibly East Indian languages lately?), that it's not the only Computerish language (imagine a billion Chinese becoming computer-literate), and that learning foreign languages is good for you (it does widen the mind and teach you that others may have rather different basic concepts than you have).

Now let's talk about American and English authors for a change. I think current programs of German origin are doing a hell of a lot so that they run on any platform.

Some American/English authors, however, seem to be blissfully unaware of other languages, other alphabets, even of the existence of characters beyond the 7-bit ASCII set. This would not happen to a French, Danish, German, Swedish, Spanish or Norwegian author because characters he/she uses every day are in the upper half of the Atari's character set.

Some otherwise rather useful programs of American/English origin are a pain to use for me because any Umlauts entered will reappear as underscores or something apparently random. Other (more thoughtful?) programs stop me from entering Umlauts altogether (Hey UK users! No pound sign either!). I don't think I'd ever register for such a program.

As if that weren't enough, some programmers go to extreme lengths and write their own keyboard drivers. (Not that their driver would have any extra functions beyond the BIOS/XBIOS.) This means that I get the US/UK keyboard layout and can't do anything about it. It's not too bad on a German keyboard because the main difference is a swapping of 'y' and 'z'. A French keyboard, however, looks entirely different, and you know how easily miffed the French are in language matters (gonna eradicate Brethonic, last I heard).

So what do *you* think about the arrogance and presumptuousness of English-speaking programmers?

|>
|> ------
|> Q: I collected replies to an article I wrote, and now it's time to
|> summarize. What should I do?
|>
|> A: Simply concatenate all the articles together into a big file and
|> post that. On USENET, this is known as a summary. It lets people
|> read all the replies without annoying newsreaders getting in the way.
|> Do the same when summarizing a vote.
|>
|> ------
|> Q: I saw a long article that I wish to rebut carefully, what should I
|> do?
|>
|> A: Include the entire text with your article, particularly the
|> signature, and include your comments closely packed between the lines.
|> Be sure to post, and not mail, even though your article looks like a
|> reply to the original. Everybody *loves* to read those long
|> point-by-point debates, especially when they evolve into name-calling
|> and lots of "Is too!" -- "Is not!" -- "Is too, twizot!" exchanges.
|>
|> Be sure to follow-up everything, and never let another person get in
|> the last word on a net debate. Why, if people let other people have
|> the last word, then discussions would actually stop! Remember, other

|> net readers aren't nearly as clever as you, and if somebody posts
|> something wrong, the readers can't possibly realize that on their own
|> without your elucidations. If somebody gets insulting in their net
|> postings, the best response is to get right down to their level and
|> fire a return salvo. When I read one net person make an insulting
|> attack on another, I always immediately take it as gospel unless a
|> rebuttal is posted. It never makes me think less of the insulter, so
|> it's your duty to respond.
|>
|> ------
|> Q: How can I choose what groups to post in?
|>
|> A: Pick as many as you can, so that you get the widest audience.
|> After all, the net exists to give you an audience. Ignore those who
|> suggest you should only use groups where you think the article is
|> highly appropriate. Pick all groups where anybody might even be
|> slightly interested.
|>
|> Always make sure followups go to all the groups. In the rare event
|> that you post a followup which contains something original, make sure
|> you expand the list of groups. Never include a "Followup-to:" line in
|> the header, since some people might miss part of the valuable
|> discussion in the fringe groups.
|>
|> ------
|> Q: How about an example?
|>
|> A: Ok. Let's say you want to report that Gretzky has been traded from
|> the Oilers to the Kings. Now right away you might think
|> rec.sport.hockey would be enough. WRONG. Many more people might be
|> interested. This is a big trade! Since it's a NEWS article, it
|> belongs in the news.* hierarchy as well. If you are a news admin, or
|> there is one on your machine, try news.admin. If not, use news.misc.
|>
|> The Oilers are probably interested in geology, so try sci.geo.fluids.
|> He is a big star, so post to sci.astro, and sci.space because they are
|> also interested in stars. And of course comp.dcom.telecom because he
|> was born in the birthplace of the telephone. And because he's
|> Canadian, post to soc.culture.Ontario.southwestern. But that group
|> doesn't exist, so cross-post to news.groups suggesting it should be
|> created. With this many groups of interest, your article will be
|> quite bizarre, so post to talk.bizarre as well. (And post to
|> comp.std.mumps, since they hardly get any articles there, and a "comp"
|> group will propagate your article further.)
|>
|> You may also find it is more fun to post the article once in each
|> group. If you list all the newsgroups in the same article, some
|> newsreaders will only show the the article to the reader once! Don't
|> tolerate this.
|>

|> ------
|> Q: How do I create a newsgroup?
|>
|> A: The easiest way goes something like "inews -C newgroup ....", and
|> while that will stir up lots of conversation about your new newsgroup,
|> it might not be enough.
|>
|> First post a message in news.groups describing the group. This is a
|> "call for discussion." (If you see a call for discussion, immediately
|> post a one line message saying that you like or dislike the group.)
|> When proposing the group, pick a name with a TLA (three-letter

WRIGHT> I'm a little out of date...

AW is a "genuine" commercial product from Atari Corp (or HiSoft in the
UK) and is a really nice word processor, spreadsheet, database all in
one...

However, the docs are also included in plain old ASCII for everyone
minus AW!

And the readme file is ASCII only...

Hey, this is getting out of proportion. All I'm asking for is that German
programmers allow the rest of the world to enjoy their excellent programs.
I already speak 2 languages and half understand a thrid.

All your complaints about English/American programs may be valid. I never
mess with the keyboard and I had no complaints from non-English users
about my programs.

Even if mail fraud laws do not apply, WIRE fraud laws probably do,
since any deal arranged over the Internet *by necessity* uses the
TELEPHONE SYSTEM, which is well established as "an instrumentality
of interstate commerce". So there is another avenue for the
gypped party to pursue.

5114. ICD controller into a MEGA STE

Newsgroup: comp.sys.atari.st
Date: 1994-03-17 05:09:03 UTC
From: karlm@highett.mel.dbce.csiro.au
Message-ID: <2m8olf$8eg@news.dmpe.CSIRO.AU>
Source record: 190871

Hi.

About a week ago I posted asking what the pinouts were so a friend (with no net-access) could connect an ICD controller to the internal SCSI drive of a MEGA STE. What the problem is is that it has 44 poins on the motherboard, and the ICD only has 40 pins if I remeber correctly. Now is this the same as the Falcon IDE with 4 pins being dedicated to power, and if so, what pins are what - don't wanna connect a +12V to a data line 8*() .....

Thanks,

Karl.

Actually,in defense of Atari Works, I must say I have only had this
happen occasionally...

But apart from that, Atari Works is really a nice general purpose WP.
It has the first spelling checker I've liked since WordPerfect, and
also has the first useful thesaurus I've ever seen on a computer.

That is what I keep on wondering, I can accept that maybe it does not
matter which SCSI port I use of the hard drive, but that the drive also
checks and adjusts the termination as well?

Then again, if it is already terminated, and I add another terminator
externally, could I do any damage to the drive or Falcon?

I work for COMPO.

There is a demo of Studio Photo; I would be happy to send it to anyone who requests it. It is also available on GEnie, in the ST File Library.

Our address is 104 Esplanade Avenue Suite 121, Pacifica, CA, 94044.
Our telephone is on 415-355-0862, and our fax is on 415-355-0869.

The most reliably way (for the time being) to reach us in email is at COMPO@GENIE.COM.

Studio Photo compares favorably to PhotoShop, especially given the price. Frankly, its main weakness is the lack of sophisticated masking tools, but we are working on that (we're developing three updates simultaneously).

Robert@COMPO

COMPO Software publishes the Bitstream Typeface Library of Speedo and Type 1 fonts for Atari computers. Bitstream themselves publish but a couple hundred.

We also publish several bundle packages of Speedo/Type 1 fonts.

Please direct inquiries to COMPO@GENIE.COM.

Robert

PS - There are around 1100 typefaces in our Typeface Library.

5125. Re: Is it possible to access Genie via Internet?

>have atari stuff that I can't find on the 'net?

Yes, it's not easy, but any service that can be reached through SprintNet can
be accessed through internet. You must have an account on GEnie to do this:

1. Telnet to HERMES.MERIT.EDU

This is Michnet which provides network services to Michigan
universities, and is kind enought to allow us to use it. One of the
networks they connect to is SprintNet.

2. Type SPRINTNET-313171 at the Hostname? prompt.

The SPRINTNET part tells it you want to make a connection through
SprintNet, and the 313171 part is GEnie's SprintNet ID code. This
code could be replaced with any valid code for any service which can
be accessed by SprintNet.

3. You will see the U# prompt appear for GEnie. Proceed with login as normal.

Bear in mind that accessing GEnie through SprintNet incurs a $2/hr surcharge on
your GEnie bill.

Also, I have had no luck get file-transfers to work. I intend to check into it
more, but just haven't pursued it yet.

CompuServe can be accessed in the same way. They have CompuServe predefined,
so entering COMPUSERVE at the Hostname? prompt will work.

Delphi can be reached by telnetting to DELPHI.COM. This is free of connect
surcharges as long as it it non prime time.

I imagine that Prodigy and AOL can be reached in the same way as GEnie if they
have SprintNet access. You would need to call them and get their SprintNet
codes.

If you need any more info, write me and I will see if I can find out.

because i haven't got a negative answer to my first article, i put pc_m109s.tos
on ftp.

you will find it at
- ftp.isbiel.ch
- Atari.archive.umich.edu (soon)

pc_m109s.tos contains a self extracting zip file (v2.4):

pc_m109s:
this version contains the complet oiginal mint108s.zoo and diff1819.zoo.
but it's already prepared for purec user. that means:

- patch -l < diff1819.txt has been done
- patch -l < diff1819.spp has been done
- the steps described in /purec/puremint.txt
- asmtrans -purec -o outfile.s outfile.spp has been done
- genmagic.ttp is needed to create the file magic.i has been done
- fixed an error in mintpure.prj (added the -P option to .C [-DMU... -P])

The Line A functions would never have been able to support Falcon
resolutions (eg HiColour) either, let alone the graphics cards on TTs
and STs.

Hmm... this might be why it's not working on my ST. I'll try disabling
Warp-9.

BTW, works fine with the NOVA VDI, so it's probably NVDI(and maybe Warp-9)'s
fault, not Speedo's.

It's just because only the ST resolutions are fully supported by
Line-A. There is some limited support for the TT resolutions (only
upto 4 planes), but the additional Falcon modes are definitely not
supported. That means, if you use Line-A your program will be
resolution dependent.

>Ofir ogal@cix.compulink.co.uk

And under MultiTOS, EVERYTHING goes slow :)

But seriously, the advantages of pre-emptive systems depend very much on what
you want out of your computer. I would put forward a case that for the type of
application that is run on an Atari, Mac, or most PC's, cooperative multiTasking
is perfectly of for general use - most people would just like to be able to
draw their graphics, edit their text & typeset their page, and have the program
in question respond when one of it's windows gets some input. As most GEM apps
sit in an Evnt_multi() loop anyway (effectively asleep), it doesn't effect the
feel of the system that much.

The advantages of pre-emptive multiTasking really come to the for when using
"power apps" which are aimed at more advanced operation systems, where a program
may take advantage of multiThreading within itself, or use child processes for
specific jobs, perhaps using remote procedure calls to code fragments which may
even be running on a seperate machine......but there are few ST programs which
support such features (I'm working on a version of CLA which allows you to
fork off digital simulator processes, but really the current version of multiTOS
is to slow for me to believe people would use it, so release is not iminant).

My view is that I would use Geneva for a work enviroment where I was producing
reports or designs in a CAD package - but I'm not willing to pay the extra money
to buy it at the moment.

I only ever use MultiTOS as a toy - it is to slow to be useful to me.
I do however, use the MiNT kernal on a regular basis, as this allows me access
to an advanced underlying OS without the performance overheads of the MultiTOS
AES (pipes, threads, sockets, filesystems (minix), process control, etc) which
allows me to do Unix/Atari development in comfort. But for Joe Public ("I do
some CAD, I do some WP, I play Minesweeper in my lunch break...") the advantage
of multiTOS over Geneva just isn't there.......

Atari have stopped developing the line-A routines - hence they don't support
new things such as graphics modes with more than 4 bitplanes. Hence to be
compatible with all machines you should use the VDI.

>I'm sure this will be followed by more detailed explanations.

It might even be followed by some correct ones :-)
Pre-emptive versus co-operative have nothing at all to do with priorities.
You may have (or not have) control over priorities on either system. The
difference between the two is when the system can decide to switch context
(ie stop running one program and start running another). For a co-operative
system (Geneva, Windows etc), a program will only stop running when it
does certain things (eg make an OS call). With a pre-emptive system (eg
MultiTOS/MiNT, OS/2) the operating system can decide to interrupt a task
and schedule another one at any time it sees fit.

This makes a big difference when running jobs in the background. However,
with GUI programs, the advantage is sometimes lost; for example, one program
puts up a modal dialogue, and you can't switch to another program even though
it is runnable.

I have seen people say that the reason for the difference in speed between
MultiTOS and Geneva is down to the difference between co-operative and
pre-emptive multitasking. This is incorrect. The main reason that
MultiTOS (as released to the public) is slow is that the AES and user
programs end up `busy waiting' on keyboard, mouse etc.

Hi netters,
Here in my office we have many X11 NCD terminals and I was quite surprised to see that they use Bitstream fonts. I asked the sys-admin if I could download these fonts and I installed them on my Atari BUT I can't have anything else than the letter "g" appearing on my screen.
So, is there something to do whit this fonts ???

Thanks in advance for the response.

From: rahin@scs.leeds.ac.uk
Message-ID: <rahin.1.000ACD89@scs.leeds.ac.uk>
Source record: 190894

Following my original post starting this thread concerning my inability to run Calligrapher on a 1040STe with about 755 KB free memory, I found a fix. Run CALSETPUP.PRG and at the bottom of the dialog box, reduce the %memory usage and also reduce minimum limit (mine was 512 KB default). It now runs ok and is definately usable albeit rather slow.

Systems Solutions, and I guess other dealers too, buy diskless machines
from Atari and fit their own drives. Therefore, no free software (apart
from the junk like Breakout).

AtariWorks & SpeedoGDOS come with Falcon030's WITH hard drives. If you got
a non-HD Falcon030, then you're not entitled to them, and if you DID get a
Falcon030 w/ factory-installed hard drive without them, then I believe Atari
does OWE them to you (unless Atari UK wasn't offering them).

Yes I sent a ADspeed back at the end of January, with a RMA number
and it was a waranty job, still no reply..

I have E-Mailed them last week on GEnie about there Tape BackUp software,
and no reply as of yet..

No wonder people are leaving the Atari platform, it been dead a long long
time....

ST-Review only does articles on big price products these days, not the ones
that you and me would buy....

No new games are comming out, a few reviews of old ones that is all I can see,
how can the UK support 3-4 Atari Mags when the Germans have now only one..??

Mind you Gribnif on GEnie got back to me in one day when I asked about Xboot
and Neo 4....

Did anyone ever manage to find the SIRD generator program
that was mentioned here a week or so ago?

I've hunted around several ftp sites and still not found
it although I have managed to find lots of SIRD piccies and
generators for PC's Mac's etc..

Anyone?....

Wrong.
Atari works is *not* included on European machines. This also goes for machines
with pre-installed HD's. It has to be bought separately.
Not even developer machines included works here (although they did had a lot of
other *very useful* stuff on them).
Works was supposed to be included on the developer cd-rom - but that doesn't
seem to come out... Anyone heard anything about it lately ?

Just an enquiry about speech recognition software for the Falcon.

I heard it mentioned a few times a while back and it sounds quite
interesting but all has gone quiet.

Is this sort of software around or is it going to appear ?

Anyone in the know please reply.

Thanks

Ronnie

5148. mono monitor fried again, need net.advice

Newsgroup: comp.sys.atari.st
Date: 1994-03-17 12:06:02 UTC
From: esj@harvee.billerica.ma.us
Message-ID: <H.eg.usu&nfk57Mo@harvee.billerica.ma.us>
Source record: 190805

about 6 months ago, my mono monitor went dead. I dragged it into the nearest atari shop and they were able to fix it. now my monitor is dead the same way and I am wondering if there are better options. as I see it, I can:

1) keep fixing the sm124 everytime it breaks.
+lowest cost
-may keep breaking

2) buy a used sm124.
+may get more reliable monitor
-may not.

3) buy a multisync that works with std atari modes.
+monitor can be used for all modes
+monitor can be used on "other" computers.
+monitor can be fixed locally
-can be a hassle to connect
-vid quality can be off

4) buy a "cheap" graphics upgrade + vga monitor.
+more bits on the screen
+monitor can be used on "other" computers.
+monitor can be fixed locally
-most expensive option
-one more thing to break (vid card)
-may overload pwr supply in mega

comments?

5153. 1040 STe with Scanner and Software for Sale

Newsgroup: comp.sys.atari.st
Date: 1994-03-17 13:43:11 UTC
From: zampino@panix.com
Message-ID: <zampino-170394084311@zampino.dialup.access.net>
Source record: 190810

This is a second posting on my Atari 1040 STe, and I'm dropping the price by $150 to try and keep the package together. I've received a number of requests for the individual pieces of this offer, but I'd really like to sell the whole thing at one shot. If noone offers to buy the package this week I'll reply to those individuals who have mailed me and start breaking the set up.

So once again:

*** FOR SALE ***

A Great MIDI/Sequencer Starter Machine
-or-
The Ultimate Backup Machine
-or-
A well priced introduction to the Atari
-or-
Lot's of Software and a Backup Machine Reasonably Priced
-or-
An Excellent Salvage Machine
-or-
...

Atari 1040 Ste
4 Meg Memory
D.E.K.A. Extended Keyboard
IBM-style Focus Keyboard with built-in Calculator
Migraph Hand Scanner (1/2 page) w/ Cartridge
External 720K Diskette Drive
External 42 meg Supra Hardrive
Shoebox style, space for another drive

Software (all properly registered and, to my knowledge, current)
NeoDesk
Dr. T's KCS Omega
Dr. T's XOR
Dr. T's Caged Artist: MT32, 4-OP Deluxe
Pagestream 2.1 (up to date)
Steno
Stalker
CodeKeys
Multidesk Deluxe
Arabesque Professional
Degas Elite
Scan-It
Merge-It

Lots of Auto programs, DA's, Shareware stuff, etc.

Selling as a group, $600.00 + COD shipping cost. Price is somewhat negotiable.

I'll also give the buyer an SM124 if they want- it works, but it's a bit flakey, and sometimes you have to slap it on the top with the palm of your hand to get a picture :) It would be fine for an exchange. I also have an SC style color monitor that works, but all of the knobs are stuck in place :(Either or both monitors for the price of shipping.

The operating system clock cannot be set past the year 2000 so files will not
be properly date stamped in the next millenium anyway. :-(

Help me somebody!
I have an Atari ST 1040 computer and the hi-res. monitor.
When I use GEM VDI library than there is a problem: Form_Dial does not work.
Namely, when I call the Form_Dial procedure which save a part of screen,
VDI does not report anything but, I guess, does not save a part of screen,
because, when I call the Form_Dial which restore a saved part of screen than
last one does not restore. The Form_Dial which operating with the boxes working
normally.
Please contact by e-mail dicky@rphd.stu.spb.su
or phone 7-812-558-5314 my name is Dima.
Thank you very much in advance.

I don't know how this works, but i have seen it before. As far as i have been
told, it can be controled with software. (which ofcouse isn't support on the
Atari plaform 8-(

To Daron: Get another drive, you can't use the above drive if it's auto terminating
on the Falcon. However, it'll work fine on an ICD interface.

There was a package made by Batteries Included (great company from the past, BTW) called The Ishgar Portfolio (or something similar). It looked to be quite comprehensive for the time. I believe there is a used copy forsale from Rising Star Computers (1-800-252-2787). I saw it a couple of weeks ago on the used stuff list from their BBS (1-513-254-7970).

Not quite PD, but surely quite inexpensive.

The Speedo fonts with X11 are encrypted differently to the Speedo
fonts that Atari/Word Perfect/etc use. That is, they are unuseable by
SpeedoGDOS.

However, (a light at the end of the tunnel?) Speedo 4.2 (out RSN) will
have this capability.

> Any help appreciated!

You can only read Mac 800k floppy disks using a Spectre GCR. However,
you do have a number of options. You could find a Mac with a Superdrive
(any high density drive), stick a 720k PC formatted disk in, and use
Apple File Exchange to write your file to it. You could also connect the
Mac hard disk to your ST and use macread.arc (from atari.archive.umich.edu)
to get the file to your ST hard disk or floppy. You could also null-modem
the file to another computer.

I suggest you get rid of that one. It appears to be prone to this behavior
:-).

> 2) buy a used sm124.
> +may get more reliable monitor
> -may not.

I own three SM124's, and have yet to have a problem. As they are so cheap,
this might be a good thing to try.

> 3) buy a multisync that works with std atari modes.
> +monitor can be used for all modes
> +monitor can be used on "other" computers.
> +monitor can be fixed locally
> -can be a hassle to connect
> -vid quality can be off

One interesting thing about this idea is that you can try to find a very
high quality used Multisync, one that doesn't have the ability to do SVGA
(and thus worthless to PC folks, essentially) but does have the ability to
do all the ST resolutions. The particular one I am thinking of is a Nec 3D.
I have seen a couple of these on STs, and they are beautify in color. High
res was also good, though not as nice as an SM124 IMHO. Still, a monitor
that is significantly better in color and almost as good in mono, in addition
to the other plusses you list about . . .

> 4) buy a "cheap" graphics upgrade + vga monitor.

>I'm working on a "Doom clone" on the Falcon, and I have to optimize
>every single instruction!

Hmmm, Doom clone? Wouldn't that be to slow? So I have to admit that i think that Lasers & Home, the existing Doom/Wolf3D Clone on the Falcon, is a bit to slow. There are nice lighteffects, and not always 90 degrees angles but I think if there would be just a nice Wolf3D Clone, running fast enough to have a playable game, it would be better...

If the Falcon030 would have the same 'features' as the A1200, it would be
cheaper then the Amiga. ;-)

Infact there is, although it's the same site as world.std.com, it has
unlimited (?) anonymous logins, the site is ftp.std.com and programs
can be found at /pub/atari/

Cheers

5169. Restricted Access on UMICH?

Newsgroup: comp.sys.atari.st

Message-ID: <01HA2T7E7HHU95PG7O@SNYONEVA.CC.ONEONTA.EDU>
Source record: 190826

I've sampled the excellent software fare from virtually every Atari oriented FTP site in existence. However, for the life of me, I have not EVER been able to get into Atari.Archive@Umich.edu...

Whenever I log on as an FTP or ANONYMOUS user I get logged off. Even when I do get into that directory, all I see are directories in capital letters which indicates that I can't access them.

As I would like to get programs with ENGLISH docs, I would appreciate it if someone could tell me how to properly log on and/or get access to this FTP site.

Geesh, I know SUNY ONEONTA (where I attend college) isn't Harvard but does UMICH not like my school or something? :)

BTW, I've tried logging on at all hours of the day and it doesn't seem to make one bit of difference. I might add that my PC owning friend never had a problem getting PC stuff off of there.

Thanks for any help regarding this matter...

That's atari.archive.umich.edu, no "@", no caps.

> Whenever I log on as an FTP or ANONYMOUS user I get logged off. Even when I
> do get into that directory, all I see are directories in capital letters
> which indicates that I can't access them.

You get bumped due to the user limits imposed at various different times
of the day. The message given when this occurs states this. When you do
get on, as anonymous (no caps), you have full access. All of the directories
for atari.archive.umich.edu are capitalized simply to ensure that they are
at the top of a directory list. Their capitalization has absolutely nothing
to do with access permission. The only directory that you don't have read
access to is /New. This is the upload directory, so you have write access.
However, an archivist must first process any new uploads before they are
available (they will be accessible through /Newitems when they are processed),
hence the lack of read permission in that directory.

> As I would like to get programs with ENGLISH docs, I would appreciate it
> if someone could tell me how to properly log on and/or get access to this
> FTP site.

There is a FAQ for this periodically posted to this group. It sounds like
you are mostly there, though. Simply:

Ftp in, user anonymous, password full-email-address.

Set binary mode. I also suggest setting hash, so you have some visual
feedback during transfers. To do this, type "bin" and "hash" followed by
returns.

Get the big index 0compind.Z by typing "get 0compind.Z".

Log off ("close", "quit"), uncompress the index file ("uncompress 0compind.Z"),
and read it. Figure out what you want, ftp back in, set binary and hash again
(binary is _very_ important, don't forget), and leech all you want.

> BTW, I've tried logging on at all hours of the day and it doesn't seem to make
> one bit of difference. I might add that my PC owning friend never had a

The umich archives are being pounded due to increased traffic lately. You
might try wuarchive.wustl.edu, in the mirrors/archive.umich.edu/atari
directory. This is a mirror of what is at atari.archive.umich.edu, and is

often easier to get to.

5172. ICD!! Are you dead?

Newsgroup: comp.sys.atari.st
Date: 1994-03-17 17:34:47 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <1994Mar17.173447.11342@beaver.cs.washington.edu>
Source record: 190829

I've tried calling ICD three times and I had to leave a message each time. I wanted to get ahold of the latest version of ICD Pro Utils for the Falcon. They never replied (this was two months ago). I send them Email a month ago about it, and I've got no reply to that either.

You'd think in such a low-demand market that companies would jump on order requests. My only conclusion is that ICD has dumped Atari. If not, then someone from ICD...please get ahold of me! AARRRGGGHHH!!

5173. AP_TERM and AP_RESCHNG messages.

Newsgroup: comp.sys.atari.st
Date: 1994-03-17 17:46:48 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <1994Mar17.174648.11867@beaver.cs.washington.edu>

I know to receive these message from AES version 4.0, you need to send shel_write(9,1,-,-). When I try to change resolutions, I then get an AP_TERM (50) message. At first I tried just exiting by closing all my windows and exiting. This worked fine, and I didn't get an alert saying "Please close all applications before changing resolution."

But then I thought about MS Windows. When you quit Windows on a PC, all the applications put up alert boxes saying "Save XYZ before quiting?" So I thought why not do that in my program. But when I got an AP_TERM message and then tried to put up an alert box, it seemed that the AES had already disappeared and I got a FATAL ERROR. But I was still able to execute rsrc_free() without any problems, which is the AES as well.

Am I doing somthing wrong? Can I prompt the user to quit when I get an AP_TERM message and then send an AP_TFAIL message if the user doesn't confirm the quit?

I called and talked to them about two weeks ago. They still have at least
one Atari support staffmember (whom I spoke to).

Also, if you want the latest ICD Pro utilities, why not call Toad or D&P
Computer Supply? They could probably give you a better price, anyway.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Since 1.5 years I also access Internet from my very home,
using an obscure terminalprogram named "PC/Intercomm" (v3.01),
written in '89 or '90 for the ST.

It's an okay program, but hasn't got the flashy interface and features
that programs nowadays offer, so I tried a few of the popular ones
and was shocked to find that (compared to PC/Intercomm)
terminal emulation ranges from irritating to a big laugh,
when talking SPEED.

Here's the ones I tried sofar:

Rufus : Slow emulation, and doesn't work well with 'vi'.
STalker : Even slower emulation, and scrolls jerky (I'm not confusing
flowcontrol pauses here.)
ConNect : Slow emulation, with a very annoying 'block-copy-like' text-
buildup in e.g. 'irc' and other types of scrolling, no matter
the settings.
FZDT 2.20: Is the only one sofar that resembles PC/Intercomm's buildup most,
but unfortunately it's vt100-emulation is so sloppy that
'vi' and 'irc' CANNOT be used at all!
Earlier in this group I read a 2.30 version won't be finished
soon (if it would solve this at all).

Obvious QUESTION: * Is programming an IMMEDIATELY RESPONDING!, FLUENT! and
FAST! terminal emulator some kind of well-hidden
secret that only the developer of PC/Intercomm
knew about ?

Either PC/Intercomm will have to be upgraded (? - it ended up in my diskbox
YEARS ago by chance, and I've never met another user or saw it mentioned
anywhere),
or those socalled 'big titles' will have to keep pace with it soon;
I'm not gonna give it up for something that shows me the difference
between 9600 and 14K4 in UL/DL CPS-rates only.

Very surprised,
RowdyB.

All of these strive to be "complient", so the use of a third party acceleration utility like Warp9 or NVDI is highly recommended. The accelerators have gotten good enough (and wide-spread enough) such that many other programs do not attempt to use custom optimized graphics routines, but instead depend upon an external accellerator instead. This is a good thing, IMHO.

> FZDT 2.20: Is the only one sofar that resembles PC/Intercomm's buildup most,

It's vt100 emulation is non-existant! There is no vt100 emulation in FZDT. Note that it uses its own custom graphics routines (which are likely not to be as good as those found in Warp9/NVDI), which is why you perceived better performance. You should check to see if you specifically set vt100 in all these programs. Some default to vt52. Note that ansi is not equivalent to vt100.

> Obvious QUESTION: * Is programming an IMMEDIATELY RESPONDING!, FLUENT! and
> FAST! terminal emulator some kind of well-hidden
> secret that only the developer of PC/Intercomm

> knew about ?

No. In fact, all of the programs you have mentioned are excellent. However, you should either purchase a screen accellerator (NVDI is better, but expensive) or get Uniterm. Uniterm uses custom graphics stuff, is nice and fast, and has excellent vt100 emulation. If you get an accellerator, I would suggest Connect. The "block" effect you mention is not as issue with an accellerator.

The last version of Uniterm is available only from chsun.chuug.ch in archive/software/atari/uniterm. It is Uniterm 2.0e015. Get it, and gszrz228.lzh (from atari.archive.umich.edu). Write two small macros so you can start Zmodem with a mouse click, and you are set. Feel free to email if you have problems with the macros. I used Uniterm for many years, with excellent results. I only recently switched to Connect, after getting NVDI and a 16mHz machine.

Also, be sure to get HSMODA02 and install it, no matter what terminal program you are using. This will fix TOS RTS/CTS bugs and give you better performance. Your vi problems with Rufus are a configurational problem (I remember doing the same thing, and fixing it with a bit of twiddling).

> Either PC/Intercomm will have to be upgraded (? - it ended up in my diskbox

One last point: for high speed modem use you should set your line speed in whatever modem program as high as you can (19200 for unmodified STs). Not doing so will negate any advantage you get from data compression protocols.

>Thanks in advance!

There is at least one program around called STalk The Market. I have no idea just what all it does, or even if it handles mutual funds at all, but you might want to have a look at it.

STalk The Market is a nifty application. Outside of music and telecommuting, it is my most used application. It is a properly done GEM program also. (I don't like hacks around the standard interface. That is why I won't buy things like TbxCAD).

I believe the latest version has a few bugs fixed that affected resolution independence.

There are some areas for improvement. Most of them have already been suggested to the author on GEnie. Although he gives great support, new features are not currently forthcoming due to low volume. Of course if you do not buy the product because of that - catch 22.

I recommend a BUY on this product. (It is NOT PD. Open up your wallet and support Atari product developers!)

Mike we are not talking about the hardware delay, but the built in delay in the later ICD booter, they say its there so you can read the boot options..

It should have been programed that you hit a key to get the delay, I don't need the delay, there is also the option to change the boot drive, ie, boot from 'E:' but there is a program suplied to turn that feature off...

djs@jet.uk (David Stevenson) writes:

>Pre-emptive versus co-operative have nothing at all to do with priorities.

Not completely true. Only under Pre-emptive multitasking can user-input
cause a process to jump in priority.

This was one of the key issues with the implementation of Unix. Some devices
are given very high priority such that user input is responded to in preference
to all other processing. Good philosophy. Under MultiTOS (4.0 at least),
user input does not have this effect.

molin@cxc1.cl.msu.edu (Michael Olin) writes:

>What kind of slowdown can one expect from the v-m drivers?

None.

If you're only using as much virtual memory as you have real memory,
there is no slow down.

For example, say you have 4M and are using 200K worth of desk accessories,
running MultiTOS (800K, say), and 3 applications which are using 2M each.

That's a total of 7 megabytes. But most of that isn't being used. For
example, all the memory for the desk accessories will end up `paged-out'
(ie. on the disk), until you actually go to use them.

Also, you rarely use all the features of every program all the time.
Say one of the applications is AtariWorks and you're editing a huge
document. The part of the document you haven't looked at in a while,
as well as all the AtariWorks code for database and spreadsheet and
printing and the dictionary and thesaurus are all `paged-out' since
you're not using them. When you go to use these features, there might
be a slight delay (half a second) as chunks of memory get moved on
and off the harddisk.

>The Falcon is not notorious for its raging fast SCSI-II port, and the
>internal IDE drive (which I refused to purchase for this very reason)
>is a dog.

Haha... you should check the speed of the average PC in the world.

My drive gets 1Mbyte/s throughput, and that is plenty fast enough.

One tip with virtual memory: don't make it ridiculously large. For
most things, 4 times the amount of actual RAM is a good limit. Any
more than that and you start trying to do things that are too large
and you machine ends up thrashing for ages moving memory on and off
the disk. It's better to simply get an `out-of-memory' error, IMO.

Oh, and make sure you set the fastload bit on any program which
you have the can-run-in-alternate-ram bit set for (or else it
clears all free virtual memory when you first run it!)

Uhm, wasn't the quoted registration price $50US!? If so, even with the crap rates for exchange we get, that's still no more than $75AUS, and about $1800 for a Falcon, so you're still out $125AUS ;^)

Karl.

ICD has not dumped Atari. In fact, they are working on yet another release
of the Pro Utils package. The latest commercially-available version is
v6.4.3, which is now also shipping with The Link, and a soon-to-be-
released v6.5.0 is currently undergoing beta testing.

If you're using RateHD to measure performance then the results are
meaningless. The Falcon SCSI is faster than any ACSI adaptor on the ST.

]
] and if some kind soul could post the site again.....

You mean atari.archive.umich.edu !? :)

atari/Archivers/esscd504.lzh

New features:

BTOA/ATOB (Binary to Ascii/Ascii to Binary) conversion support, slightly
slower than UUE but a fair bit more efficient as far as filesize goes.
Fully Modal windows & dialog boxes
much improved on-line help
Plenty of new user-configurable options
Existing file splitting and appending of existing files.
v5.xx is even faster still (VERY fast)
The progress report display is more friendly with multi-tasking environments
(and it seems to calculate the percentage done much more accurately now :)

If you use UUE/BTOA etc. and have an ST, this is the best program for
the job. No contest!
```

5192. New Tape Drive and ICD

Newsgroup: comp.sys.atari.st
Date: 1994-03-18 03:10:07 UTC
From: whitema@rtsg.mot.com
Message-ID: <2mb62f$fi2@delphinium.cig.mot.com>
Source record: 190849

Hey all!

I just received my tape drive last night, and I forgot to buy a tape (duh).
I tried hooking it up, but my drive would not boot up with the SCSI
terminator installed on the tape drive (it's an ICD SCSI+). It seems
to work good without the terminator (the ICD "IDCHECK.PRG" recognizes
the device correctly, an Archive 2150), but in the tape drive manual
it says that there must be a terminator installed. I've tried putting
the terminator on both ports (not at once, though), but the hard drive
will not come up - it just blinks once and I get the "default" desktop
(the one with two floppy drive icons only). Should I worry about this?

Thanks,
Michael

5193. SCSI Hard Drives, Atari H/W S/W FOR SALE - *REDUCED*

Newsgroup: comp.sys.atari.st
Date: 1994-03-18 04:27:15 UTC
From: steveg@cseic.saic.com
Message-ID: <21674193@MVB.SAIC.COM>
Source record: 190850
Cross-posted to: misc.forsale.computers,comp.sys.atari.st,dc.forsale,misc.forsale.computers.other

I posted this STuff for sale a few days back and have determined
things have depreciated more than I thought. There's a pending offer
on the Mega CPU, everything else is still up for grabs. If you think
I'm still asking too much, make me an offer.

All h/w is in perfect working order except one of the monitors and the
SLM804 as noted below. All s/w includes original disks and manuals.

HARDWARE

Atari Mega ST: $400 **** SOLD / ON HOLD ***
4 Meg RAM
ICD AdSpeed 16Mhz Accelerator
Switchable TOS 1.0 / 1.4 ROMS (run all those old games!)

Atari SM124 Mono Monitor $75

Atari SC1224 Color Monitor $120

Atari SC1224 Color Monitor $75 (Has slight/moderate "pin-cushioning" or
"hourlgass" problem)

Atari SF314 External 720K Floppy Drive $40 (Will throw in w/Spectre GCR)

Atari SLM804 Laser Printer $300
w/ UltraScript PostScript Interpreter and
UltraScript Type Collection PS 35
Atari LaserBrain (Epson Emulation for SLM804)
Atari Diablo 630 Emulator

NOTE: There is a light scratch on its drum that leaves a fine vertical
line .3 to .5mm (the thickness of fine point mechanical pencil
leads) blank approximately 2" from the right margin. When
printing text it's hardly noticed as the blank output area often
ends up between letters. For serious DTP output a new drum would
be needed but for casual printing and drafts I wouldn't bother
(and haven't for over a year!).

ICD AdSCSI Host Adapter, 65MB Seagate *AND* 100MB Quantum in 2 bay
"under the CPU" case w/fan w/ICD Boot s/w 6.2.0 $250
(Buy this I'll throw in Cleanup ST)

SyQuest 44MB Removable Cartrige SCSI Hard Drive w/6 carts $400
(carts alone would run over $400 retail, and if you
have an ST, I'll throw in a 7th cart with Current Notes'
stuff (see below))

Aside: at the moment the Syquest and Quantum are mounted in the case with the host adapter, and the Seagate is in an external floppy case connected by a very ugly but reliable ribbon cable extension. Can reconfigure to suit desired combinations.

Monitor Master Switch $15 (free if you buy both mono and color monitors)

Drive Master Switch $15

Sound Off! Cartridge audio digitizer with editing/manipulation s/w $25

Mac Emulation

Spectre GCR (w/ v3.0 Software) $275
Mac Software: System 6.05 w/disks, manuals
Hypercard w/disks, manuals
MacDraw Pro w/disks, manuals

SOFTWARE (all w/original disks & docs)
---
* - Denotes available as part of system purchase only or once CPU is sold. (I use them daily!)

Take 5% off total for each additional title you want, up to 30%

UTILITIES:
*NeoDesk 3 $30
*NeoDesk CLI $15
*UIS III $10
*Warp 9 Screen Accelerator $15
*MultiDesk Deluxe $15
*Diamond Back II Backup Software $15
*ICD Cleanup (disk maintenance s/w) $15
Revolver $10
ProCopy $5
Double Click Utilities $10
*G+Plus (GDOS Replacement) $10

APPLICATIONS:
Word Perfect v4.1 $75
PageStream v2.1 $75
*LDW Power Spreadsheet $45
Easy Draw w/Supercharger w/ Atari GDOS $30
PC Ditto I $15
Microsoft Write v1.0 $5 (useless but a conversation piece)

PROGRAMMING:
Mark Williams C v3.06 $60
Mark Williams CSD (debugger) $15
Mark Williams BC (arbitrary perecision calculator) $10 (free w/above two)
Prospero Pascal $60

TELECOMMUNICATIONS:
Shadow $10

GAMES:
*Dungeon Master $15
*Chaos Strikes Back $15
*Lemmings $15
Falcon $15
Bloodwych $15
Heros of the Lance $10
Dragons of Flame $10
Star Wars $10
RoboCop $10
Gauntlet/Road Runner/Indiana Jones/MetroCross Pack $15
Space Ace $15
Uninvited $10
Wanted (TOS 1.0 Only) $10
Xenon II / Bombuzal Pack $15
Defender of the Crown / StarGlider / Barbarian Pack $20
Winter Games/Mouse Trap/Plutos/Blood Fever/Seconds Out/Frost Byte Pack
$15
Golden Oldies - Classic Games: Adventure, Eliza, Pong, Life $15
Hellraider $10

PD / SHAREWARE:
Current Notes Disks #347 thru #459 on 44MB SyQuest Cart $85
(Will toss in with Syquest bundle above)

With system purchase:
Tons of utilities and games
Megabytes of picture and sound files

As the author of CoNnect let me mention a few things.

* For a GEM compatible terminal emulator CoNnect is without any doubt the fastest emulator you can get. GEM forces you to take some speed loss into account but using one of the well know vdi accellerators (I recommend NVDI) you won't talk about display speed any more.
* The 'very annoying 'block-copy-like' text-buildup' can be controlled by the user in the DISPLAY dialog. There is a switch 'Fast Scrolling' which you probably haven't found yet. It's a matter of taste if you want to use this switch.
* Try pressing the HELP key whereever you encounter any problems. If you had done so you certainly wouldn't have made the above statements ;-)

>so I can complete my cross-compiler system?

The complete sources are available in ~ftp/Atari/Gnustuff/Tos/Gas/gassrc04.zoo.
All patches have already been applied to the sources in this archive.

Some day someone is going to take the time to port the GNU bfd library to the
Atari, and we'll be able to use a modern gas and gdb...

Hello,

Currently I am using an Atari Mega STe2 with Minix 1.5.10.3 with
an external Ampex 230 terminal, connected to my Mega with the
Modem1 port.
However, when the system sends it's data to the serial port, it
get's through, but it print's a sia: transmit error. This is done
by a plain printf in the source, so it goes to all my virtual
tty's. I know the serial ports on the Mega STe are different,
does anyone has a solution?

Hello,

While using my Mega STe with Minix 1.5.10.3 I noticed that
the infamous 'wrap around bug' (that is: The screen breaks of too
soon at the right side, and appears one scan line lower on the left)
ONLY appears with my while using Minix.
The patch I downloaded redirected the XBIOS call 'setscreen' to
more or less patch the whole thing. But, I could not find any
XBIOS calls in the kernel source. Does anyone has a solution?

>Not completely true.
Oh yes it is :-)

>Only under Pre-emptive multitasking can user-input
>cause a process to jump in priority.
No. A job can have it's priority mangled at any time under either system.
The difference is that a pre-emptive system will usually schedule the
highest priority task as soon as it is able (so the i/o bound jobs get
a high priority and start running as soon as input is available), but the
co-operative system *can* mangle priorities, but will still only schedule
when invited to do so.

The difference between Pre-emptive and co-operative is purely a `when to
reschedule' issue. Your example (below) details a case where pre-emptive
scheduling can give you an advantage in better handling of flexible
priorities.

>This was one of the key issues with the implementation of Unix. Some devices
>are given very high priority such that user input is responded to in preference
>to all other processing. Good philosophy. Under MultiTOS (4.0 at least),

It makes no difference if you make a XBIOS call or a direct access to
the register. The bug is not in XBIOS, its in the chip. All bugfixes
are workarounds.

More is in the GDOS driver FAQ.

SL is so closely linked to the clock speed of the ST that it will not work with an accellerator. Logic should though.

As for as I know, the AS400 is some sort of mainfraim manufactured
by IBM. It is resonably old, but still used...
So, the A does not stand for Atari ;-) Pity.

I'm using How-fast (freeware) to measure hd performance at Gemdos level,
and SCSI-tool (payware) to measure performance at Bios level.

The AS400 is a mid-range minicomputer made by IBM. It comes in various configurations from something like a small filing cabinet up to wall to wall cabinets full of processors and drives. Runs OS/400 and is a replacement for the system 36/38 of many years back.

Probably losing popularity from what I'm told. Used to use them in a previous job and thought they were crap :-)

I do know Notator is very picky about clock speed etc. In a recent
(the latest?) Sound on Sound in the Atari notes section there is a good
piece by Vic Lennard about CPU upgrades etc which has more details
(I don't think it mentions ATspeed explicitly though). Notator
won't run with CPU clock increased above 8mhz, on a Mega Ste you
have to disable cache etc...

However, Notator Logic will run on faster machines.

> partition that you can have, and if so what is the limit?

Assuming that you'll be using a Gemdos filesystem (TOS filesystem):
1. The maximum number of logical sectors Bios can handle is 65535.
2. The maximum number of clusters Gemdos can handle is 32766.
3. The maximum clustersize Gemdos can handle is 8KB (Falcon-TOS
can handle clusters > 8KB).

Example with a sectorsize of 4KB (2 sectors per cluster):
1 bootsector
2 rootdirectory sectors (256 entries)
32 FAT sectors (2 FATs, 32766 entries each)
65500 data sectors (== 32750 data clusters)
+-----
65535 sectors total -> 262140KB -> ~256MB

Example with a sectorsize of 8KB (1 sector per cluster):
1 bootsector
1 rootdirectory sector (256 entries)
16 FAT sectors (2 FATs, 32766 entries each)
32766 data sectors (== 32766 data clusters)
+-----
32784 sectors total -> 262272KB -> ~256MB

Of course it would be possible to install these filesystem on partitions
larger than 262140KB and 262272KB respectively, you would be wasting
diskspace though.

Maybe some spec sheet says it's faster than any ACSI adapter, but my
experience in useability says otherwise. Not that I care to re-attach
my 520fm and the old host adapter to find out, but I can say without
fear or favor that PageStream loaded quite noticeably faster on my
old setup than it does now on this 32MHz Falcon. I find myself agreeing
with Charles Johnson's assessment on a daily basis: The Falcon is one
tired puppy.

Hop on over to atari.archive and look for ST_ZIP24, LHARC299, and
ST_ZOO214. They'll be under /Archivers (or is it /Utilities/Archivers?)

A good desktop application to have, especially if you're gonna attach
a hard drive, is called DIRSORT. (It allows you to arrange to order
of programs in any folder, but is most useful when used with the AUTO
folder...)

Another good one is called AZT, which checks your critical booting and
config programs to see if they've been altered in any way. A good hedge
against virus damage.

CAL63, an excellent appointment calendar.

Commercially, look for Universal Item Selector (an alternative file
selector,) MultiDesk (allows loading .ACCs on the fly,) and EdHak (a terrific
text editor plus.)
Don't ever boot without 'em! If you find a program that conflicts with any of
these, it's likely not worth using. And don't overlook either Warp9 or
NVDI (screen accelerators.)

Don't you wish! Unfortunately, there are international trading laws to prevent this. European countries (and Australia & NZ, too) enforce very stiff import duties on certain US products. They generally don't take too kindly to black marketeers, either. :)

My original question, however, was to the bloke in Sweden who commented that ATARI prices were quite reasonable while other US computers were exorbitantly priced. Since it 'seems' they should both fall under the same import laws, I didn't understand the disparity in cost.

>Worst: the French AV-MACs have been sold with a no-complete package

It's a minicomputer made by IBM, used mainly (exclusively?) for non-technical applications in small to medium environments, up to perhaps 100 users?. It's been around for perhaps 10 years. It can run IBM s/36 software (or is it s/38?) as well as native software and has a sort-of object-oriented operating system with a built-in database management system. Actually, the correct name is AS/400. There have been umpteen thousand machines sold.

Og> Ofir ogal@cix.compulink.co.uk

Ofir,

As documented on the read me file, if you change the clipboard drive to "Z" in STalker 3.02, it will use the Atari Clipboard. Any other drive letter and it will store the clipboard file on the specified drive. This "Z" drive support is what STeno is lacking.

The whole problem developed when Atari came up with an initial clipboard standard (which we implemented in STeno and STalker). They gave us the go-ahead and we released the programs. Months later they called back and told us they changed their minds (sigh). So, STalker supports both methods (for compatibility with older programs {like 1st Word Plus} and STeno) and STeno currently only supports the old method (but we have plans to release a fixed version supporting the new method).

multi-tasking?

Also, which of Mtos, Mag!x, Geneva uses which (if any) desktop?
(A table of features would be useful: E.G:

Feature-1 Feature-2 .......
Mtos yes no .......
Mag!x no yes .......
Geneva yes yes etc etc
================================================

A desktop is an application program, NOT part of the OS. Fight about
this all you like, but you can use any desktop with any app. Its just
that not all support running of apps concurrently with the desktop.
Those that do, and follow ATARIs guidelines, should work with all 3
systems mentioned.

Cooperative - similar to Wind-slows or MAc sys7. A program runs until
it requests an event from the OS, such as an AES event.
The OS then polls for events and gives the event to the
program that needs it. Some events, like Timer events will
go to background processes. Most other events will only go
to the active (top) window. Window moves and such can be
sent to background events.
Pre-emptive - An application runs until the OS says the program has used too
much CPU. It uses Timer hardware to multitask so that ALL
programs can run concurrently. Events are handled much like
a cooperative system except that there is no time when all
apps are waiting for events (well, no guaranteed time!) so
the system polls for events when any program asks for events,
so polling and program execution happens simultaneously, unlike
cooperative systems. This accounts for the slowdown you see.

Why is pre-emptive better? Programs that want to do something that uses
LOTS of CPU can do so withot locking the system from other programs. Ex.
A serial program like ZMODEM would have to steal interrupts or find some
way of sending and recieving data during Timer events which makes the
system inadequate at high speeds (check out an MS-Windows terminal).
A pre-emptive program could do the transfer normally and the OS would
determine when to swap tasks, not the programmer. In fact, you could
make multiple MiNT threads and use blocking IO, so that the GEM interface,
and the serial transfers all worked independantly and each would only use
the CPU time it needed (without ever polling the serial ports).
```

MultiTOS - loadable file systems, redirection of BIOS, pipes, other unix-like features, pre-emptive, official standard.
Geneva - cooperative
Mag!x - Very fast, replaces entire OS, pre-emptive, will have pipes in future

TERMCAP=tw|tw52|toswin window mgr:al=\EL:am:bl=^G:bs:cd=\EJ:ce=\EK:cl=\EE:cm=\EY%+ %+ :co#80:dc=\Ea:dl=\EM:do=\EB:ei=\Ei:eo:ho=\EH:ic=:im=\Eh:it#8:le=^H:li#25:md=\EyA:me=\Ez_:mh=\EzB:mi:mr=\Ep:ms:nd=\EC:rc=\Ek:rs=\Ez_\Eb@\EcA:sc=\Ej:se=\Eq:sf=^J:sr=\EI:so=\Ep:ta=^I:ti=\Eq\Ev\Ee:ue=\EzH:us=\EyH:up=\EA:ve=\Ee:vi=\Ef:

Sorry, this damn Linux system can't service the serial port right.
I'll post the table you asked for later.

Have you tried the mirror sites to it? and have you got my ftp list. There are many good FTP sites with English docs/menus available.

Here it is:

```
()=========================()
// ____/__ __/ ____/ //\\
// / / / _/ // ()
// __/ / ____/ // //
// / / / // //
// _/ _/ _/ Archives // //
// // //
()=========================() //
\\ \\//
()=========================()
```

(log in with "anonymous" as name, and full name/e-mail address as password)
FTP instructions after this list!

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions:
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR] OR use the number address,
NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once. i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having to reply "y" for each
file
when asked "get {filename}?".
12) close [CR] to end (go back to ftp and
13) quit [CR] to go back to UNIX or.......
14 bye [CR] to end and go back to UNIX (or 'close' if you only want to quit the FTP site
you're
on for the moment)

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on which the
programs

were intended, or in UNIX .....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after uncompressing .Z and/or .uu.
Use the appropriate uncompress program for this.
- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys, xlinksys etc...) i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh, xlba.lzh etc...)
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to another computer (use an
other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:- mdir [CR] to show disk-directory/space left.
- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)
- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for "low density")
- mcopy a:{filename on disk} {copy filename} [CR] to get a file from disk to computer.
i.e. "mcopy a:dlist.txt dlist.txt"
- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

In article <CMr349.AwA@cwi.nl>, Jaap Henk Hoepman <jhh@cwi.nl> wrote:
>- What's the difference between MiNT and MultiTos?

MiNT is the kernel that MultiTOS uses. MultiTOS = new AES + MiNT

> Should all programs for MiNT work under MultiTos as well (e.g.
> tcsh). And maybe even more important: do all programs written
> for TOS work under MultiTOS?

Yes, and for the last one .. maybe. If a program is a properly written
TOS program that does not screw with hardware or try and call a fileselector
from a Text program or a GEM program that does BIOS outpuit to the screen,
then yes it should work. Hybrids will work but will mess up your screen.
Programs that steal vectors or access hardware directly will likely crash.
GFA basic programs and others than use memory illegally will likely crash!
TCSH should run fine in a window, although its kinda big. I prefer bash myself

>- Which Cli/Shell should I use?
> I'm hooked on gulam on the st, and use tcsh at work. Does
> gulam work on the Falcon? Does it also work under MultiTos?
> If tcsh for MiNT does not work under MultiTos, is there a
> similar shell that does?

TCSH and bash should both be fine. Gulam doesn't understand the new MiNT calls
though, so I'd stick to MiNT aware shells.

>- C and other languages
> So, I'm not a big C fan, but alas I fear I'll have to use it
> on the Falcon. I specifically want to program the DSP. Which
> compilers support that (Sozobon C, GNU C, maybe the Modula2

The DSP is 56001 code, and must be very tight. You cannot write a
program in C and expect the compiler to make 56001 code for it. You
have to use a 56001 assembler and write in assembly code. These assembly
programs are then uploaded to the DSP using XBIOS calls. Any C compiler
will support these XBIOS calls, even if you have to edit the include files
yourself.

> compiler). How hard would it be to adapt the libraries of
> compilers that do not support it. And where do I get the
> libraries for MultiTos.

MultiTOS does not require separate libraries, although your best bet is to
get the MiNTLIB as it will make MiNT calls when required, and I THINK the
GEM library for GNU supports the new AES calls of MultiTOS's AES. If not,
then you could likely hack then if you had the source to the library.

5236. Trakballs

Newsgroup: comp.sys.atari.st
Date: 1994-03-18 17:45:42 UTC
From: trek@cbnewse.cb.att.com
Message-ID: <CMvG0F.AJD@cbnewse.cb.att.com>
Source record: 190791

Someone asked for a followup on the trackballs so I figured I would post it generally. -The comments below are from my son who is the primary trakball user in the family. They are used on 8 bit, 520ST, and Megas. Wayne

---

Hi, I have a bunch of trakballs, and I love them.
1) They need less space than a mouse, and are fun to play with.
2) With a trakball you can move the pointer much faster than a mouse.
3) The only difference is that you really need both hands to operate it at max efficiency.
4) I prefer it because it is much more reliable. (I had a beetle mouse and the buttons broke, as well as the tracking being screwed up.) I have had a few times when I have smacked the trakball, but it is still going strong.
5) The only other problem is that it can get gunk in the rim so occassionally needs cleaning.

My dad will post the address of the place we got these after this part of the note.
Jonathan
(kamakazi@imsa.edu)

Trakballs obtained from MTS Creations
PO Box 56762
Chicago, Il 60656
1-312-763-1822 -from ad in 2/94 Current Notes

Note: prices range depending on options (right hand/left hand switch, ST/800 switch, pool ball/standard ball selected), the computer the trakball must work with. Prices range roughly from $8-$30. Wayne

: FTP site in existence. However, for the life of me, I have not EVER been
: able to get into Atari.Archive@Umich.edu...
^
This "@" should be a "." as in:

prompt: ftp atari.archive.umich.edu

That and the fact that a.a is very busy (don't ask me why?) makes it very
hard to get on using the anonymous logon. They (umich) has just recently
put logon restrictions on the msdos.archive as well. :(

: As I would like to get programs with ENGLISH docs, I would appreciate it
: if someone could tell me how to properly log on and/or get access to this
: FTP site.

at your prompt enter: ftp atari.archive.umich.edu
at the username prompt enter: anonymous
at the password prompt enter: your.own.name@your.own.site
(eg. FELDAK79@SNYONEVA.CC.ONEONTA.EDU)

and if the is a connection open, you're in! :)

: Ari

ps: If you can't get on to atari.archive try msdos.archive.umich.edu.
If you get on then just cd to the atari directories.

Considering the rapid decay of Atari application software - Atari machines have a wealth of impressive comm software.

I agree that some are better than others at certain tasks but it doesn't give you the right to knock something unless it truly is a piece of crap. And, to my knowledge none of these comm programs fit into this category.

If you want a comm program with decent VT100 emulation, I suggest that you try STORM. It can be found at most major FTP sites and can be patched to upgrade its performance (also on the FTP sites).

As I have fairly light telecomm uses (i.e. e-mail and newsgroup reading), I won't comment on STORM's performance other than to say that it has very good VT100 handling.

I'm able to use the VMS EVE full-screen editor w/o any problems and it supports VT100 text attributes properly. STORM also uses a custom text output routine so terminal text is updated quite rapidly.

Hope this helps...

Ari

You can't damage either of them Daron. (don't worry).
If the drive you have auto detaminating, then it can be controled via software.
Unfortunatly we Atari owners do not have such a software available.

I will try locate the right commands, as i have never seen this before. Another
guy told me yesterday, so now i want to know for sure.

Just follow the screws. The three underneeth the floppy drive should not be
removed, cause these are used for holding the floppy drive.

> How should the metal shielding inside be removed?

Again, just follow the screws. When you first have open the case, you can't
go wrong.

From: fvkampen@cs.vu.nl
Message-ID: <CMvpqs.33L@cs.vu.nl>
Source record: 190654

hello,

I am currntly working with version 1.2 of Deluxe Mjuzakk Z.K.
It is an extremely nice program, with lots of features.
BUT (:-)) I was wondering if there was a newer version available,
because of some (minor) bugs... (sorry)
So, If anyone has some desolate ftp-site where I can find it.
(I checked the sited on the atari-ftp list, distributed some
weeks ago here). Anyway, thanx in advance!

Greetings

From: jhogan@uqac.uquebec.ca
Message-ID: <CMvu4z.7CE@uqac.uquebec.ca>
Source record: 190655

Hello,

You know, I seem to be able to get on to UMICH when I want to, with out hassle.
But, I can't do it directly with the FTP command. I have to use my brother
account, which has a beautiful automatic setup. It does all of the work.
It is PINE, or GOPHER or some other system. The school I am at, does
not know what GOPHER is. I even have to use KERMIT. It works, but
I wish they would install some kind of ZMODEM.

That just says that you have to find a good friend with a good school
or business that seems to get 'special' treatment. I lucked out,
but unfortunately, both of us will be losing our accounts soon, due
to the end of our academic career. DAMN, I gotta get a job!!!!

Oh Well, take care

Joseph

5254. Re: Using Pure C with another editor?

Newsgroup: comp.sys.atari.st
Date: 1994-03-18 22:51:04 UTC
From: hjv@phil.ruu.nl
Message-ID: <2mdb8o$bc1@chico.staf.phil.ruu.nl>
Source record: 190656

olov.johansson@p4.stacken.ct.se (Olov Johansson) writes:

>Can someone tell me how I should do to make Pure C work witth an editor such as
>Everest? I'm _so_ tired of Pure C's editor now, cause it's so slow, and you
>can't have a smaller font than the normal 'big' one... If someone could tell me
>how I could set up my system to work with an 'extern' editor, I'd be very
>happy! I know that Everest is made to work with Pure C, but I'm not so sure
>about how I should do to use the errors I get when I compile my programs...
>(Yes , sometimes I get errors! :-)

Funny coincidence... Recently I encountered Everest too, and since I hate the
PC editor as much as you seem to do, I asked myself the very same questions.

Now there's a problem: it is not possible (in a straightforward way, that is)
to get hold of the PC error messages. It's obvious that this is a *huge*
drawback of using an external editor.

And here is the solution: I decided to write a PC shell -- i.e. a program that
allows you to easily switch between compiler, assembler, linker, editor and
resource-editor. The shell will be able to perform most normal PC tasks --
i.e. setting of comp/ass/link options, invoking 'make', 'debug', 'run',
'compile', 'link', 'execute', etcetera. And the best part of the story: it
takes care of the compiler output (i.e. warnings/erros) being sent to a file
instead of the screen, so that you'll be able to use Everest's error-handling
feature.
Now ain't that nice of me? :-)

But... I only started working on this thingy a week ago, and I'm very busy so
work doesn't progress as fast as I'd like. That means it will probably take a
few weeks before it's up and running -- but as soon as it is, I'll post an
announcement in this newsgroup. So keep your eyes wide open for a subjectline
like "New upload: shell for Pure C".

In the meantime: try to live with things as they are...

5259. HardDrive woes!!!!

Newsgroup: comp.sys.atari.st
Date: 1994-03-19 03:39:08 UTC
From: Joseph_Hogan@UQAC.UQuebec.CA
Message-ID: <9403190339.AA10434@infocom>
Source record: 190661

Hello,

I would like to ask some help of any one out there with hard drive experience. I will state the problem first.

I lost a partition!! My system does not recoginize it.

I have five partitions on my harddrive, and only for of them register as being in existence. I can access C, D, E and F, but G does not exist. Actually, it is the fourth partition that has disappeared.

Okay, here is what I did up to the point of the disappearance.

I was running Speed of Light v2.6, while under Geneva v1.02 in low resolution. I tried to view a file, and then while the GIF file was loading, I got an 'illegal AES' call, and then Speed Of Light exited and I was back at the Geneva screen(no desktop). I rebooted(warm), and I brought up the newdesk(TOS 2.05), and I went to open up drive F, which is where my Comm programs are, and where my incoming files are. Instead of coming up with my files on that partition, I saw files from what I thought were on drive G. I made sure I opened the right drive, and I did.

I tried opening up all the partitions, and there were only four that would open up. The 4th partition was missing. I loaded up Diamond edge, just to get a look at 'All the partitions' info, and see if they were all there. There were four partitions shown, not the 5 that I knew I had.

Next, I loaded up the ICD format program, to check out the existing format of the HD. There are indeed 5 partition on the disk, but I haven't got the foggiest idea how to get to the 5th one. If there if any one who can help me, give me ideas, I would be very greatful. I'll even buy you one of the 'Virtual' beers.

Thanks for any help that you can be. My hard drive depends on it.

Thanks,

Joseph

Source record: 190663

Is is sort of relating to the langugae thing. Does anyone know of a keyboard driver for the ST for the Irish Gaelic language as like a replacement? There is a program similar to this on the Mac called Irish Accessories. It allows you the use Fadas and the like. Or does anyone know how to edit the standard character list? It seems that to have a letter with an accent over it, the letter is still in a lower case size with the accent over it. I was thinking that for letters with accents one could use a captial letter size but the letter itself being in the lower half of the space witht he accent being in the upper half. Anyway, does anyone know the answers to these? Much appreciated.

5263. Problems with IcePack v. 2.4

Newsgroup: comp.sys.atari.st
Date: 1994-03-19 05:57:22 UTC
From: gustavo@arcana.uchicago.edu
Message-ID: <1994Mar19.055722.18749@midway.uchicago.edu>
Source record: 190684

Hi,
Just the other day, I downloaded IcePack v. 2.4 from
archive.umich.edu, which is great for compressing those huge
Photochrome pictures.....when it works. I've been getting an "exception
error - illegal instruction" message from ANTIBOMB at the end of the
process in roughly five out of ten files I have tried to compress. Is
this thing incompatible with certain versions of TOS? (I have 1.0 but
I'll upgrade soon). What else could be the matter? Has anyone else had
this problem? Any help will be appreciated.

Gustavo

5264. STReport

In STReport #1010, Ralph F. Mariano says:

> "Drop that also-ran like a hot rock!"
>
> Ralph....

I have a much better idea, DROP STR like a hot rock! In the past I felt like Ralph was getting a bad rap from those who criticized him. But suddenly I have come to realize they may have been right. I have downloaded STReport for the last time. As far as I am concerned there is not enough room on a disk for such trash!

Message-ID: <J6+MIBX.dowdle@delphi.com>
Source record: 190665

Richard,

To the best of my knowledge, no such FAQ exists concerning games available for the 680x0 based family of Atari computers. I'm not sure of the status of FTL Software either, but I do know that Dungeon Master and Chaos Strikes Back (a sequal to Dungeon Master) are being sold together as a set now. Contact your favorite Atari software vendor for more information.

If you have Diamond Edge, did you try restoring your partition scheme?
(You _did_ save your SCSI info to disk somewhere, didn't you?)

Source record: 190693

RowdyB.,

I'm not sure what terminal emulations you want but if you are talking ANSI... color ANSI in fact... and SPEED... then the shareware title ANSITerm is for you. It isn't really loaded with all the features one can think of but it does a very good job and it is very fast. I use STalker for most everything (yes, even at 14.4Kbaud... and yes, GEM terminals are slower) except when I need something that does good 16 color ANSI... or when I need the display speed picked up.

You could try the Apple File Exchange application on the Mac to copy the file over to a PC floppy. Alternatively, there's PC Exchange which allows Finder to read/write to PC-formatted.

Cheers

Jakes.

>
> If so where can I get it? Is it PD?

I got an ACC from GEnie written by Sol Gruber that takes a string, and a Calamus font, an exports a CAD-3D extrude template. I also got another utility from GEnie that converts this template into a better CyberSculpt extrude template. Then I load it into CyberSculpt, and export a CAD-3D2 object. Then I run my cad3d2raw program to convert the CAD-3D2 object into RAW triangles. Then I run raw2pov to create a POV-Ray object, and run POV-Ray to render the CAD-3D object.

This is good, since the GEMini Atari CD-ROM has loads of Calamus fonts on it, and I don't have Calamus.

I think there's an OMEN demo on atari.archive.umich.edu; looks
interesting (and quite cross-platform, including the Mac, etc) but the
development kit is unreasonably expensive (IMHO), especially if they
want Atari support...

Fire up desktop.prg (or desktop.acc, for older versions of ICD), and make
sure that the partition is enabled (indicated by a checkmark). I have
managed to scare myself a couple of times this way :-).

I would prefer some virtual vodka, BTW. Hope this works (sounds likely,
since ICD format reports that the partition exists).

This might be off the subject, but how do you use the viewer that comes with Photochrome? I saved a bunch of GIFs as PCS pictures and the PCS viewer loads, accesses drive A then goes back to the desktop. I tried the install application viewer APP and it loads the picture just fine, then stays there until I reboot. It would be nice to show these pictures without rebooting everytime.
Later,

I have a 1040ST 1Meg, TOS 1.4 and a 130Meg hardrive with ICD drivers.

From: glenn@loose.apana.org.au
Message-ID: <2mflpd$c5r@loose.apana.org.au>
Source record: 190706

I have a 1040 STe, a Kurzweil K2000 and a Syquest 105 removable. I need a
SCSI controller for the STe that allows me to run the STe and the K2000
on the Syquest (i.e. 2 hosts).
The local Atari dealer (rudely) told me that there are no SCSI
controllers for the ST that let you run 2 hosts. In other words, for Au$240
I get to put drives on the ST but I cant put my sampler or any other host
on the system.
I hope this isn't true. For one thing the SCSI controller should cost
half that, and I should be able to share the removable between the K2000
and Atari. OK it is not an ideal world but there is something fishy here.
Please tell me ,anyone, what SCSI controllers can I use on a STe and can
I have another host?
Any info greatly appreciated.

> Florentijn

The AS/400 is a midrange system like a minicomputer, and it is not very
old. It was released in 1988 and new versions are released quite often.
It is mainly used for business type applications, but can used for
client/server stuff.

YOuve changed the directory since you unpaked the GENMINI arc file.
Delete yr current GEMINI and unpack again. IT is all something
to do with INSTALL.MUP etc ... I tried GEMINI2 once actually I
prefer the earlier version. This one seems to have sometning to do
with UNIX and C users which I am not......Also I have the impression
from the authors docs that he was fed up with it.#
SERIOUSLy it's probably great. I'll translate the docs into every
day-Atari-user english shortly so hold on till then.
Unpack GENMINI2 into the area (partition) that you wish it to remain
in. More later...

The LINK is only intended for external connection to a MAC/PC box type hard drive, the ADscsi would be far better for those that make there own box and that one supports Parity, the LINK does not.....

> I have another host?
> Any info greatly appreciated.

Well, if I understand you correctly, here are some pertinent points

1. Your two devices certainly could not read/write to the device at the
same time.

2. Your two devices _may_ be able to both be hooked to the same SCSI bus
that the Syquest is using. For example, if you had an internal ST host
adaptor connected to a 50 line SCSI ribbon cable which ended in an external
Centronics style SCSI plug (I have seen them set up that way, from Toad
computers for one), you could probably plug the other device into that
external jack and use the drive from the K2000, given that the computer
to which the host adaptor is connected is turned off. That is a guess :-)

3. Another option would be to use an ICD Link, which is an external host
adaptor, and simply plug the drive into whatever device you want to use
at the moment. This is sure to work, given that other jumpers on the Syquest
don't have to be manipulated every time (like parity, for example).

Note that when you say "controller", you really mean "host adaptor". The
Syquest has its own built-in SCSI controller (as does any embedded SCSI
drive).

I have tried to use both hackfax and coma.. coma I figured out and actually
got it to send a readable fax...

hackfax sends a shortened (unreadable) fax.. and receives a garbled mess...

Can people put their heads together and _define_ a received fax standard file.

Coma can not read hackfax received faxes... sendfax cannot send files
generated by wp2fax.. it a BIG MESS...

Welp, I just got me a DeskJet 550C today. Prob is, the 550C driver w/ Speedo doesnt seem to work.. It just ejects the page completly. I have it set to Final, letter, and B/W (tried all colors too).

Right now I am using the DeskJet 500 driver which works, but I would like to use the DeskJet 550C driver instead...

Anyone else have probs or did theirs work fine? I recopied the driver so its not that... but my version of Speedo is 4.1, and Works is 1.(0)2.

thanx.

John has been very good about answering questions and taking bug reports etc. I sent him some captures of VT emulation bugs I encountered in the demo of 2.2. He sent them on to the programmer and has kept me informed about what is going on. He said that when the bugs get fixed, they may release a new demo.

One of the problems that I made him aware of was the new Z-Modem capability. From what I have heard, only a handful of PC programs support this new version of Z-Modem (and possibly Storm although *I've* never gotten Storm's Z-Modem to work AT ALL). Does anyone have a summary of the advantages/changes from older versions, and possibly even where to get new source so that I can pass this on to John?

BTW, I don't even own Flash II yet, but as soon as the VT bugs are gone, I'm there! <g>

I know that several responses have been posted concerning getting in on umich, but I must add one since there is one option that I have not seen mentioned. I found this in one of the files in the Info directory I think. It has served me well when umich is busy.

If you have gopher access, gopher to nic.merit.edu and choose Merit Software Archives on the main menu. Choose Atari on the next menu, and you can use gopher to get your files. Files marked with <PC Bin> will automatically default to saving to disk when chosen. Text files can be viewed or saved. Pretty nice actually, since you no longer need to worry about binary or ascii mode for files. I think it is a little slower than FTP, but it works when the archives are busy!

Well, I have been using Flash 1.6 with our school's VAX, and have only found a couple of quirks with the VT100 emulation which are simply limitations of the program (Bold and Blinking characters show up as inverse). Flash 2 looks very promising in that respect as well. I had a major problem with the VT emulations on our VAX running VMS when DEC_CRT is set (the default), but I passed these on to John Trausholdt, and they should be fixed. I expect to be upgrading to Flash 2 soon.

Hi Ari!

F>Living here in the US has its advantages but not when Atari specific
F>info is concerned...
Well, Germany might help you ;-)

let's see:

F>Does anybody know the status of GFA-BASIC 4.0 - the much heralded
F>release that is supposed to fully support the Falcon?

I don't find the - written - info about it in the ST-Computer magazine, but I think I've read that it takes some to be released
F>Does anybody know if and when the 386 version of COMPO's FalconSpeed PC
F>emulator is slated for release?

I don't know about that. But Hard&Soft (German dealer with lot's of Atari-stuff) is about to release a DOS-Emulator based on a 486SX-processor. They wanted to introduce it this weekend on a show in their shop. Maybe there'll be some info about it from people who have been there ...

F>my 4/85 SC1224 60hz RGB machine
Think you should get a VGA-monitor soon (with a 'graphics-card' like Screenblaster, BluowUp030 or screen resolution card ...). Save some money. If you want to use a DOS emulator with your Falcon, a VGA should be strongly recommended ...

I don't have ftp, so I don't know from which site you'll get the games. One way would be: send me an envelope with some money and a disc (filled with soft) and you'll get it from me. Address comes if you send me an email asking me to do it.

Bye
Stefan

From: hwl0978@gemini.tntech.edu
Message-ID: <GJ2MBIWQ@math.fu-berlin.de>
Source record: 190744

The documentation to WINX 2.1 mentions that WINX can be installed on TOS 1.xx without the use of GEMRAM and will only occupy 16k. It also states that only a subset of the patches is used in this mode. What it doesn't say is exactly what patches are applied when run in this mode. I'm using a 1 Meg machine, and memory is tight. If this method will add enough functions to be useful, I may install it this way. I know the author of WINX reads this group, so could you please tell me exactly what features are/aren't available in this mode? Thanks.

5309. Bootup configurators?

Newsgroup: comp.sys.atari.st
Date: 1994-03-20 11:10:30 UTC
From: hwl0978@gemini.tntech.edu
Message-ID: <NJ2MB93Q@math.fu-berlin.de>
Source record: 190745

I've been using DeskManager in my auto folder to allow me to change boot configurations, but this program has not been updated to take into account such programs as ACC13.PRG and XCONTROL.ACC.

What I would like to find is a program similar to DeskManager that will allow accessories to be located in a subdirectory (ACCS) and will allow selecting CPX's at bootup.

I looked at SuperBoot 8.1, and it allowed the accessories to be located in a subdirectory, and I thought I could use one of the configurable file types for CPX's, but it wants those files to be .??X when deselected instead of .CPZ like XCONTROL does. Also, it didn't have preset files like DeskManager has (although I could live without these if the other 2 things can be done.)

Any suggestions?

Like wow.......I have 8 partitions C-J, and the ones that went missing were E and F (Minix Partitions). I had just installed Minix onto these, and when I booted up in TOS, E and F were there, but the last 2 I and J were not existent. What had happened was that the MINIX partitions were not there, and the G had become E, and H had become F and I had become G, and so on....

>haven't got the foggiest idea how to get to the 5th one. If there if
>any one who can help me, give me ideas, I would be very greatful.

I tried the ICD utils that came with the Link, and all partitions were
there.....that relieved me a bit. However, what I did not understand was that
when the comp. booted up, it only registered 6 out of the 8 partitions.

So I tried the Desktop program, and some of the other utils that came with the
Link. The Minix Partitions did not have any names...I did set names on these
partitions before.... So I placed names for these partitions, saved the info,
and rebooted. Wow....everything was fine, and has been since then.

So here is my experience on something similar. I have TOS2.06, and the
partitions concerned were Minix ones.

Hope this helps, and tell me how you get along.

>I'll even buy you one of the 'Virtual' beers.

I don't drink beer, but thanks anyway....how about a virtual Tequilla Surprise?

>
>Thanks for any help that you can be. My hard drive depends on it.

No probelm....

>should really do when they receive this? Abort? Save sufficient state to
>be able to restart, and then abort? Close all workstations, wait for the
>all-clear, and then reopen everything?

First, you have to tell the AES with a shel_write() call that your program
knows about res changes.

If the message comes in,

Prompt the user with an alert saying something like:

"About to change resolution [blah blah] - Save Abandon Cancel"

If the user selects "Save" or "Abandon", do so, close all windows and terminate
your program.

If he/she/it chose "Cancel", there is another message you can send back to the
initiating program to inform it to stop the res change process.

bye, Peter

> CPX's at bootup.

If you want the best of the best, get XbootIII. It is a bit pricey ($34 from
Gribnif, if I remember correctly), but also very capable. It can certainly
handle the CPX's, and I am pretty that it allows for ACCs in a folder.

Incidentally, I developed that opinion after finding that DeskManager would
not work on my new MegaSTE, because the newer TOSes use newdesk.inf files
instead of desktop.inf. I grabbed a bunch of of boot managers, and was
disappointed with all of them. I also dug up the ads and reviews for XbootIII
and had just about decided that I would have to buy it. Then, just for kicks,
I sector-edited a copy of DeskManager to use newdesk.inf instead of desktop.inf
files (same number of characters, so an easy hack). It works perfectly!
Thus, I am $34 richer . . .

I've used HowFast1, but wasn't sure how accurate it was. Some of the
results were a bit anomalous. For example, on a 340 meg Quantum SCSI-II
drive attached to a Falcon, it reported read rates maxing out at ~1.8 MB/s.
Testing the same drive on a Mac reported rates ~2.8 MB/sec.

I know the DMA port on at least the Mega ST's was bandwidth limited to a
maximum of 1.4-1.5 MB/sec. Does the Falcon have a similar constraint at
1.8 MB/s? I.e., the drive can do much better, but the Falcon can't? Is
there any variation in HD speeds caused by loading from video refresh?
That is, do HD transfers run faster at the less intensive ST modes than
in the 256 color (and true-color) modes, just like the CPU runs faster
in those modes due to less bus contention?

I also vaguely recall that when I tested an older drive (an LPS240) that
I had gotten rates ~1.2+ MB/sec with both RateHD and my own benchmarks on
a Mega ST, that HowFast1 maxed out at ~900 kB/sec. Since I couldn't read
much of the German documentation, I wasn't sure if there wasn't something
I was overlooking. Plus, the Write rates were always significantly lower,
which seems strange unless a verify pass was being done?

HowFast reads/writes data from/to disk using the Gemdos systemcalls.
Obviously the reported transferrates will be lower than with RateHD,
which messes around on hw register level.

Sounds like you need to update your driver software. Drivers supporting
the XHDI 1.1 (or 1.2) standard will handle partitions with an ID "RAW"
(instead of "GEM" or "BGM"). Minix.xfs can handle minix filesystems on
"RAW" partitions, but Gemdos will not be able to access "RAW" partitions.
Gemdos will know that those partitions exist, but when it tries to get the
BPBs for those partitions BIOS will report an error.

] Hi are the Falcons still being shiped with out Manuals..??
]
] A Dealer here N.Z. brought a Falcon from the UK. has built in
] Speedo/Works, and the later TOS 4.04...

The machine in question is/was not a standard public model, it was packaged as a dealer model. It was also bought about 4-5 months ago, so the situation is not likely to be the same!

] But no manuals, he has been told from the firm, ? in the U.K.
] that there is still no Manuals...

A lot of the Falcons were shipped without manuals, and supposedly you could send your registration card to Atari and they would send you the manuals when they were ready.

]He did not tell me what manuals that were missing, but this does not
]help in selling Atari Falcons here...!!!

As there are probably less than 50 people in the country that know of them, and even less that know that this non-chain store is selling them, then I don't think manuals would make much difference!

Also, the people that would know of them, are pretty much only Atari-users, and should be able to work out how most of the (very simple) programs work!

> > whatever CoNnect v2.46 had on atari.archive ..)
>
>Try this: get very.long.filename newname
>
>ftp should then rename the file to 'newname' before saving...

Yep, so doing a "get thisfile.tar.Z thisfile.tz" will save the file on
your system (PC or whatever) as "thisfile.tz".

Another little helpful thing you can do with FTP is type "hash" at
the ftp> prompt. This should turn on the "hash marking" which will
display some sort of character (probably a "#") at some arbitrary
points in the downloads (usually every 1024bytes or 4096bytes).
This way you can get a "feel" for how fast the download is going, and
how far it has gone...

One last trick that may help some of yunz if you're trying to get Max
files to run under Spectre GCR. Sometimes you might run across a
file with spaces in the filename (like "This Is a File"). If you
try typing "get This Is a File" you'll probably get a file-not-found
error or something like that. The trick to getting such files is
to put QUOTES around the filename - so you can do something like this:

ftp> get "This Is a File" thisfile

will save that thing as "thisfile"...

This should work with nonstandard filenames with spaces and other
funky characters in the filename.

Ain't the internet fun? :-)

Blame Atari on that one - if the built-in system was written with optimization in mind, there wouldn't be any need for Warp9/NVDI, etc. Those programs use official "GEM" programming, so they are limited by GEM (or GEM enhancements) but should also stay compatible with any future upgrades, graphics cards, etc. Some programs that are written with optimization (such as Uniterm, which BTW is an excellent program in its own right) work fine in the modes they are written for, but then are limited by just those things as well. It's pretty much "which limitations do you want to work with?"

These term programs aside, I'd use Warp9 (or NVDI) regardless as the speed increase shows up in almost everything...

>How much _is_ NVDI these days, and who sells it that can be accessed
>by the outside world?

Not sure (it's a bit pricey at least) - in the U.S. you could probably get it from Toad Computers, etc. Not sure outside the U.S...

Warp9's been working fine for me, so I haven't found a need to swich over as of yet...

You can rebuild one partition (and without loosing data) within ICD format
program, but i'll not promis you, that your data is safe after this.

If your FAT is gone, you'll probably loose your data, if not, then everything
should be as before thr problem, when you choose to rebuild one partition.

>Address 0". Does anybody have any idea what happened to the drive and how I
>can fix it?

Class 3 is an 'Non-recovered media error', basically a bad block. In this
case, it's block 0 which is your boot sector. Looking at my SCSI docs.,
I believe Code 25 is 'Defect List Error', which could mean that your
drive's list of bad blocks is corrupted. In this case, I can't really
suggest anything. It is possible, in some cases, to tell the drive to
re-initialise its defect list, but doing so is a bad idea since you
might also erase the factory defect list. So, it would appear your drive
is toasted. Unless anyone else has any suggestions....

Cheers, Steve

It is about $100, with shipping and all. The big difference between
Warp9 and NVDI is the acceleration of GEM graphics. Warp9 does very little,
NVDI does a whole lot. I own both, and can honestly say that NVDI is worth
the extra money even if you have already bought Warp9. It is excellent!
A significant feature of NVDI is that it includes a highly optimized GDOS.
Having GDOS around all the time is very nice (surprisingly, at least to me).

I believe you want the GNU Jargon file. Archie should be able to find it in
numerous places (prep.ai.mit.edu should be the main source). It is a bit
large, but handy to have around (for the occasional grep). It is also
hilarious, BTW.

5359. MegaSTE GST Shifter upgrade (help!)

Newsgroup: comp.sys.atari.st
Date: 1994-03-21 05:50:42 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2mjcji$dmj@mailer.fsu.edu>
Source record: 190746
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Ok, early MegaSTEs had a problem with their GST Shifter chips, that would cause crackling on DMA sound and a mono screen wrap problem. The fix is to install a GST Shifter chip later than rev D. I have such a MegaSTE, and am trying to perform this upgrade.

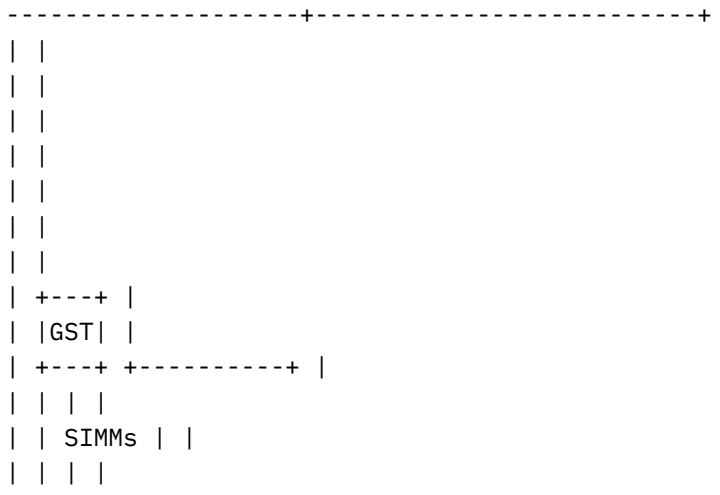
I called Best Electronics, and was a bit disappointed with the answer. Basically, they have some GST shifters, but they don't know when they were made (or what revision). They suggested that I write down all the markings on mine and call back with a description. Basically, I am hoping that I can precisely identify what chip I want, so I can call back and ask if they have any. So, I basically want to know what the markings are on the "good" chips.

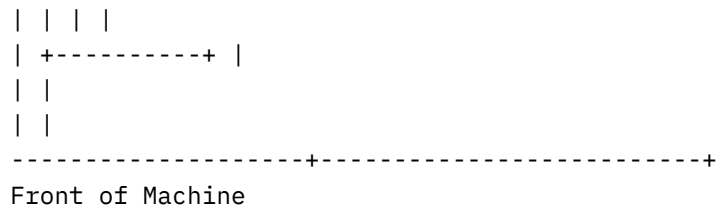
Thus, I have two questions:

1. Would someone (or several someones) who own MegaSTEs be so kind as to tell me what the markings on your GST Shifter chips say? My markings, and a description of how to find it are below (you can see it by simply lifting the hard disk cover section, complete disassembly is not necessary).

2. Does anyone have an alternate source for Atari chips? From other posts, I get the impression that some European countries have more responsive Atari branches than the one in the US (which currently seems to be totally engrossed with the Jaguar).

Ok, when viewed from the front of the machine, the GST Shifter is the largest PLCC chip you will be able to see with just the hard disk cover removed. It is right next to the upper left hand corner of the SIMM slots. The writing will be upside-down. PLCC's are the square ones with the loop-like pins on the sides, in sockets.





Front of Machine

Here is what is written on mine (rightside up):

9101 AMB
C301712-001
c Atari 1990

5360. 68000

Newsgroup: comp.sys.atari.st
Date: 1994-03-21 06:08:07 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <2mjdk7$pk7@golem.wcc.govt.nz>
Source record: 190747

Are there any 'teach yourself Atari 68000 assembler' files available anywhere? I don't have a chance of finding any books on the subject in this country (:( ) and am getting a bit sick of this slow routines in my programs, some faster methods of doing things would make life much quicker! :)

(Plus, I can use all the info' I can get, I've so far taught myself, GFA-Basic, STOS, Pascal, a bit of C (I'm waiting for C++) but you can never have too much knowledge :)

Message in a nutshell:

Wanted: Atari 68000 Assembler tutorial - preferably free ASCII file!

Thanks in advance!

Yes you can. Assembler gives you varicose veins in your nose from having
it pressed against the cold metal for so long.

There is a very good graphic front end bolted onto GnuChess that runs fine on the Falcon. It's one of Warwicks I believe.

> It's possible to run it with only a few files in the root, though I'll
> update this using the same method as Spacewars 2000, a file called PATH
> containing the path

The program seemed to run a check of all its relevant data files, and if one of them was missing (including the doc file) the program would not run. The path idea is fine, but why not just leave the path out of the program altogether? It's not nececessary to specify a path at all; instead of searching for "\filename.ext" or "<path_file>\filename.ext" just look for "filename.ext" as that will look for the files in question in the current directory.

> Anyone want to be a graphics artist?

I wouldn't mind giving it a go. I've done plenty of graphics for my own programs, and while I'm not the consummate artist, I can do game pieces fairly well.

> Memory constrants - unless someone wants a 2meg only game!

Not really, no, actually; but to be perfectly honest the game wouldn't have lost any of its appeal without the sampled speech. Plus you could have used smaller sound effects that are already available. (As opposed to the sampled voice of whomever did the cavalry charge. :-)

> Memory constrants, also don't know any decent AI algorithm. suggestions
> welcome

You could use the point system. Basically, what you do is go through all possible, legal moves and assign a point value to each move depending on its effectiveness against the opponent. You then keep going into deeper "levels", working out all possible moves and countermoves and assigning point values to each (the level of difficulty is often determined both by how many adjacent squares away your program looks when determining viable moves, and how many levels down your program searches for all possible moves and countermoves). At the end, you tally up the points and determine which gets the highest score, and then go with that move. This is how most games that use logic to determine computerized opponents moves are done.

It's hard -- very hard and tedious -- but it works.

> Well anyone else think it's too few?

As compared to the original Archon it seems to be; four power points don't offer much of a struggle. A game often lasts far less time than a game would in Archon, which had six. At the very least, allowing the editing of power points would be nice. (their locations, that is)

> Errm you're meant to be sampling your own into the game, there aren't meant
> to be any in the archives.

What is an MBK file, anyway? I don't program STOS so I have no idea what they're supposed to be. (Other than some form of graphic file) The only MBK files I could find were in another game that I had deleted from my hard drive, but for which still existed one of its folders, and inside which happened to be an MBK file. However, it wasn't of any use.

> Update due after Easter, providing I get graphics b4 March 24th
> other suggestions welcome

Different terrain in attack sequences would be nice. This needn't take up any more RAM since you could just load these as needed; they're small and won't take much time on floppies, and users of hard drives, such as myself, would certainly appreciate the effort. And getting rid of TCB Tracker would be nice, too; I have the assembler source for an older version of ProTracker Replay if you're interested. (and can probably modify it to show a Degas pic as it plays the MOD, too) This would allow for the use of better opening music in the form of a real MOD, as opposed to a TCB MOD, which doesn't have volume variation or any of the other nice things MODs do. (And if you need a MOD, I compose them quite regularily and could probably write something for you)

********* XBOOT ***************

To me there is only one and its called Xboot, Gribnif are the USA agents for this Great Boot Util, I have just Ordered the lastest Version 3.1 from Gribnif, I think its $35us....

It does ACC/CPX's and uses SET's and you can Set DeskTop INF files and up to 2 types of SYS Files, will also run a script to set up a Ram disk and copy some files into it...

If there is some thing better, Please let us know....

One good piece of German software that been coverted to English...

In a message of <17 Mar 94 08:33:04>, Michael Olin (1:286/2) writes:

MO> The Falcon is not notorious for its raging fast SCSI-II port,
MO> and the internal IDE drive (which I refused to purchase for this
MO> very reason) is a dog.

RATEHD reports 1481 K/S on the Seagate 31200N that is connected to my
Falcon030. When I hook that same Seagate 31200N up to my Mega STe, ratehd
reports 1183 K/S. I have a friend with a Quantum drive who is getting between
1600 and 1700 K/S on his Falcon.

Of course the internal 65 meg IDE doesn't perform as well - it only gives me
819 K/S.

I don't know what you classify as "raging fast", but the Falcon does perform a
LOT better than the Mega STe as far as SCSI drive throughput.

anisko> I'll have to see if it works with Geneva as well...

According to last night's GEnie RTC, Winx should not be used with
Geneva. Geneva apparently offers "all the benefits of Winx" on its
own. I asked specifically about using the window gadgets of
non-topped windows and the answer was yes. Geneva even lets you
manipulate window gadgets with the keyboard, apparently...

Now, can someone tell me if the German CPX, Wincolor, works with
Geneva or if Geneva offers a similar function? I like having
non-topped windows colored (well, shaded) and setting my own colors
(shades/patterns)...

I guess I've downloaded and tried to make 'Connect' work at least 10 times now, but it just won't de-compress properly. I've tried downloading from different sites, but it always stops up at a certain file.
The first two folders in the program decompress fine (/connect and the second one- can't remember the name), but when the 3rd folder comes it always stops up at the 'readme' file and won't continue to decompress. What's wrong? Have anybody got this program to work? Where have you downloaded it from, and what decompression program have you used?

I've downloaded the latest English version, can't remember the site. I've been using a RAM-disk on a 2MB STE w/TOS 2.06 and 'DC Extract'.

Any solution to the problem?

>
>So? They just give a damn about the other 40% of the market instead of simple
>translating the program and distributing TWO versions? I do wonder what goes on
>inside their brains!

If it were _that_ simple, they would do it! Translating a program isn't that easy. RSC files have the tendecy to change from version to version. So you have to change the english version over and over again. There are other ways, e.g. configuration of the RSC via an ASCII translation file, but that's extra work, too (I'm doing just that at the moment). Keeping the manual up to date in a language you're not familiar with is also a problem. It is much easier to do this in your native language.
But the main aspect, why german authors don't bother to translate their programs/manuals is that it usually isn't worth it. I've written a program for the ATARI ST/TT which is distributed as shareware and comes with english manual and RSC. What do you think, how many people from outside of Germany registered?

It's about 3% so far!!

If writing and reading in english weren't one of my hobbies, I wouln't go through the procedure of translating it. And exactly this is what goes on in most german programmers brains!

Ciao,
Arne

5379. Calamus 1.09on Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-03-21 17:02:36 UTC
From: ac382@FreeNet.Carleton.CA
Message-ID: <Cn0y0C.JFu@freenet.carleton.ca>
Source record: 190511

Has anyone gotten Calamus 1.09 to work on the Falcon? Mine does not work properly (it is an original :). Is there a patch available?

thanks

YEAH!!!

I am happy to say that I received a response from the writer of Diamond Edge at Oregon Research Associates. I also received many responses from many of you out there, and I tried all of them to no avail. Then I received the reponse from ORA, and my partition was saved. Here's how:

I was getting ideas to rewrite the partition info, and i tried that. I also got a couple of others, like maybe the partition was not turned on, and I verified that, and it was on the whole time. ORA(thanks Bob) told me to rewrite the sector information, or something like that. It worked, and it worked well.

I have now backed everything up, and I will be prepared if it happens again.

Thanks to all who sent me ideas.

Joseph

Sanjay> appreciated. . .

I would say that is a LOT steep... My SM124 refused to turn on, too,
so I went to the local good electronics store (Stark Electronics) and
picked up a package of 250v 3A mini fuses and replaced the bad one.
It took 15 minutes (10 to find the screwdriver!) and cost $2.45.

Also, a used working SM124 can be had for $75 here on the net!

5386. Atari ST games for sale

Newsgroup: comp.sys.atari.st
Date: 1994-03-21 18:51:43 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <94080.135143STIRRE31@MAINE.MAINE.EDU>
Source record: 190632

I recently upgraded from a STe to the Falcon and have found some
"problem" games. So, I decided to sell them off and perhaps
make enough money to buy Llamazap.... assuming Atari releases it!
Here are the games I've got....
Microprose Golf
Gauntlet II (I can't get it to work despite what I've heard!)
Epic
Mean 18 Golf
All have manuals and the original disks, of course.
Also.... has a version of Civ come out that fixes the color problem
on the Falcon? I really hate the color on it!
Please e-mail me if you're interested!
sincerely,
scott tirrell

] Coma can not read hackfax received faxes... sendfax cannot send files
] generated by wp2fax.. it a BIG MESS...

With the Zyxel I had, coma was sending and receiving VERY clear faxes, much clearer than a normal fax to fax transfer would appear as (Clearer than any I've seen anyway). Coma is incredibly simple to use, and fast. It's 'dial directory' leaves a bit to be desired (Like a 'delete' or 'edit' option, although a text editor will do the trick), but other than that, it's great!

It even seems work work 100% in a multitasking environment!

It is very likely to be DC Extract, as this is a relatively ancient piece
of software. Get lharc299.tos, it is excellent.

Oh, I have gotten it to work with no problems. Be sure to get both the
2.46 distribution AND the 2.46 update (both of these, and lharc299 are on
atari.archive.umich.edu, among others).

It is a bit steep, as one can purchase a used SM124 for much less without
too much effort. However, as far as the repair goes it sounds about right
(a couple of hours of labor, and $0.02 cents worth of parts :-). If it
completely fixes the problem, and if the monitor was in good shape (and thus
will presumably be when you get it back) you might as well go for it. If
the monitor was not the greatest previously (bad alignment, not bright
enough, etc.) then you might want to roll the dice and get a used unit.

This might be fixed by expanding the transmit and receive buffers with
HSMODA02. You will have to use setter.ttp to play with the settings (though
the defaults are bigger than TOS's, so they might work).

>Does the latest AHDI allow me to access disks of 2GB size? To partition
>and high-level format them correctly?

Most probably yes, but only with TT or Falcon machines

For TTs, 255 MB is the max partition size (511 MB with third-party formatters).

On Falcon030, I formatted drives beyond 1 GB (true gigabytes, 2^20 bytes)
successfully with HDX, and 1023 MB partitions seemed to work, too.

HDX used was 5.04, driver AHDI 6.06 was used. One time I even made a 1023 MB
partition bootable, with no noticeable problems.

The drives were Fujitsu M2694ESA.

btw, there is no high-level formatting, neither in DOS nor in Atari systems.
The "format" command in DOS just test reads the partition and writes a DOS file
system to it. These two steps are done by HDX after formatting and when
partitioning, respectively.

bye, Peter

Hi out there,

can anybody answer the following questions ?

1) Is there some atari-faq ? Which site can I find it ?

2) Is there a good public-domain terminal program for the 1040ste, which
supports the ZMODEM batch protocol ?

3) I tried to use arc.ttp on a 1040ste and it doesn't work at all. That is, it
start up, asking for a command line but when I ask it to extract some files
from the arc-file it goes back to the desktop. Since it does work on older
1040st's, it seems to be a problem of the ste in particular.
Does anybody know, where I can find a version of the program arc.ttp, that
has been tested on the 1040ste?

Thanks,

Jiri Hoogland

>I want to install a math coprocessor in my Falcon, can someone explain
>how to open the Falcon? Which screws on the back should be removed?

The seven screws sitting in square holes. Do not remove those in round holes.
Remove any disk from the drive, then pull the top half of the case upward.
There are snap-in noses on the left and right side, so some force might be
necessary.

>How should the metal shielding inside be removed?

By removing the screws :-)

You need to remove the smaller part of the shielding, unplug the speaker while
removing the shielding, unscrew the power supply (2 longer screws), and there
you are.

bye, Peter

I know of no PD one. As for Shareware, there is Connect (excellent, but
a bit slow on 8mHz systems), and Uniterm (coupled with GEM RZSZ to give it
Zmodem capability).

> 3) I tried to use arc.ttp on a 1040ste and it doesn't work at all. That is, it

Arc 6.02 works fine for me on a MegaSTE. I use Arcshell 3.1 to give it a
nice user interface. It (and all other programs I mentioned) is available
from atari.archive.umich.edu.

There are some docfiles on atari.archive.umich.edu that describe how to
build a multisync box for STs. It should include all the sync rates.

>>>| twice as big as it should be..."

Being a sysadmin, I get to see a lot of these things. Here's a list I
came up with just off the top of my head:

IMHO = in my humble opinion
also: IMO

BTW = by the way

AFAIK = as far as I know

ROTFL = rolling on the floor laughing
also: OTFL, ROTF

RTFM = read the friendly :) manual
also RTM, RTGDM (gosh darn? :)

FWIW = for what it's worth

FYI = for your information

FAQ = frequently asked (or answered :) questions

There's lots more, but I'm short on time right now.

>Sorry, but the only way to read a Mac disk at all on an ST is
>by using Spectre GCR.

Bollox. I dunno, all these people who just don't think ... :^)

1. You can use a util called GHOST to format a disk that the MAC and ST can
both read, then use something like transverter to nab the file.

2. Connect the two computers via serial link and download the file ...

3. Use the Discovery cart in place of GHOST for another item 1. ....

Just a few ways,

Karl.

Ev> Why is pre-emptive better? Programs that want to do something that
Ev> uses LOTS of CPU can do so withot locking the system from other
Ev> programs. Ex. A serial program like ZMODEM would have to steal
Ev> interrupts or find some way of sending and recieving data during Timer
Ev> events which makes the system inadequate at high speeds (check out an
Ev> MS-Windows terminal). A pre-emptive program could do the transfer
Ev> normally and the OS would determine when to swap tasks, not the
Ev> programmer. In fact, you could make multiple MiNT threads and use
Ev> blocking IO, so that the GEM interface, and the serial transfers all
Ev> worked independantly and each would only use the CPU time it needed
Ev> (without ever polling the serial ports).

I think you are missing the point. In an ideal system I would agree that "pre-emptive" is better ;-). But that is not case with the Atari. When we designed Geneva we were not trying to write "the ideal operating system".

Our goal was rather simple. To design a multitasking solution that offered maximum compatibility and the best physical performance for users of current hardware and current software.

I am the first to agree that "on paper" MultiTOS is a substancially more complete multitasking system for the Atari. The problem is on how it was implemented. It runs very slow on current hardware (a 68030 is minimum for good performance), has serious compatibilities with older software (which most users happen to have), and requires large amounts of memory (which most people never seem to have enough of).

I always feel uncomfortable when reading "comparisons". Because on paper, almost anything looks better than Geneva. Geneva's power comes on its physical performance. It runs just about anything, amazingly fast (there's almost no overhead), is small (under 200K), and its AES is faster than the one it replaces. Most existing Atari programs were optimized for the cooperative GEM evironment, allowing them to take full advantage of Geneva.

Geneva is already compatible with Warp 9 and NVDI. In future releases it will be compatible with both MiNT and PowerDOS. This means that you can customize your system as much (or as little) as you want.

We've never tried to sell Geneva as a better solution than MultiTOS (read our literature). If you want a pre-emptive environment where you can run your compiler in the background and hack away, MultiTOS might be the environment for you. But if you want to load Calamus, PageStream, WordPerfect, and 15 desk accessories at once (and NOT crash).
Well, Geneva's just might be for you. ;-)

ANSI-Term and others use a half-width font in Low-resolution to get the 80*25 character set.

Trying to do Spectrum-512 type tricks with comms would probably not work too well. (Although, if Photochrome can do '32000' colors on an STE on a static screen, it _might- be possible to manage 16 colors on a 640*200 medium res' screen and use it, (although it'd be horribly slow!).

Why not a 640*200*256 GIF viewer? It'd make them look a bit better! :)

Iain is probably referring to the ST-Low-only graphical version I did some time ago.

I have just today uploaded my latest 100% GEM GNU Chess port to atari.archive.umich.edu, in the file `gemchess09.zip'.

It's GNU Chess version 4.0pl62. The GEM GUI is version 0.9 - I'm expecting plenty of comments from Real Chess Players as to what's wrong with it, then in a month or so I'll upload a final version.

See separate posting for more details.

5434. Who's Who in the Atari Community E-Mail Directory

Newsgroup: comp.sys.atari.st
Date: 1994-03-22 06:37:23 UTC
From: xx004@cleveland.Freenet.Edu
Message-ID: <2mm3n3$hpu@usenet.INS.CWRU.Edu>
Source record: 190582
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,rec.games.video.atari

All of the updates of this list can be found on the Cleveland Free-Net
Atari SIG in the Atari Library. It will be posted on Usenet very rarely
so visit CFN often!

Cleveland Free-Net Atari SIG's
Who's Who in the Atari Community E-Mail Directory

The following people are members of the Atari Community that do things that
helps Atari users and the Atari Community in some way on a continuous basis.
They are Atari BBS sysops, dealers, developers, publishers, user group
presidents, writers, FAQ maintainers, etc. They are even Atari employees.

Everyone on this list gave their permission to be on this list.

If you contribute some way to help others in the Atari Community on a continuous
basis and would like to be made more available through e-mail incase someone
wishes to contact you, please send e-mail to the Cleveland Free-Net Atari SIG
at: xx004@cleveland.Freenet.edu

NOTE: Only people that send us information themselves will be included on
this list. In other words, you cannot just give us information about another
user that should be on the list. THAT user has to give us information
him or herself.

Report any changes to: xx004@cleveland.Freenet.edu

This list may not be reprinted for profit.

Atari user groups may reprint this list without permission as long as
the following information is included on the top of this text file:

Cleveland Free-Net Atari SIG's
"Who's Who in the Atari Community E-Mail Directory"
telnet freenet-in-a.cwru.edu
(216)/368-3888
type 'go atari' at any menu

Press "/" at the page break and then the last name of the individual
that you wish to contact. If the individual is listed, information should
appear on the screen.

Arranged in alphabetical order (last name first).

5435. UPLOAD: *GEM* GNU Chess 4.0

Newsgroup: comp.sys.atari.st
Date: 1994-03-22 06:38:36 UTC
From: warwick@cs.uq.oz.au
Message-ID: <2mm3pc$7k3@uqcspe.cs.uq.oz.au>
Source record: 190583

Just uploaded to atari.archive.umich.edu:

GNU Chess 4.0 with GEM User Interface version 0.9

Supports colour, monochrome, graphics card, MultiTOS, any RAM, etc.

Requirements:

1 computer

The package contains a 512Kbyte version and a 2Mbyte version, and
I can produce arbitrary other versions.

It is patchlevel 62 of GNU Chess 4.0, but version 1.0 of the GEM GUI
will be attached to patchlevel 68, or whichever is current when the
time comes.

The current version is 2.5. It is resolution independ and runs also in
color.

Ledpanel shows HD and floopy read/write access, date and time and caps lock
state. Lots of things can be configured (spaceing between leds, time/date
format...) with a GEM program.

Greetings, Karsten

From: Gordie Meyer <biblinski@delphi.com>
Message-ID: <J4yMgzy.biblinski@delphi.com>
Source record: 190587

As one of the managers for DELPHI's Atari SIG, I can tell you that there is no Doom clone available on DELPHI. At least, not anything that's called Doom. We do have the Lasers and Men beta version, somewhere, but it's F030 specific, and available via ftp all over.

Maybe he was confused? Bob Brodie did mention that both Doom and Castle Wolfenstein had been ported to the Jaguar during a weekly Conference a couple weeks ago. Maybe that was where the confusion got started...

No, it's 35 khz. 70 hz vertical refresh rate, 500 lines. (That's why
you could get 496 lines of vertical resolution using overscan...) I
doubt that a regular VGA monitor will cope with the signal, since regular
VGA was still 60 hz, 31.5 khz.

5443. CAn I use the internal HD for sampling with Cubase audio?

Newsgroup: comp.sys.atari.st
Date: 1994-03-22 10:39:21 UTC
From: S925377@mailserv.cuhk.hk
Message-ID: <S925377.16.764332761@mailserv.cuhk.hk>
Source record: 190594

Hi,
I am using 4mb ste.
I just want to know if Cubase Audio for Falcon works with the internal HD
for sampling. That saves me lots of money if it can.
And can I use the 120ns simm ram from ste to Falcon, after installing F
wing? will it be too slow. That saves money too.
Malcolm
s925377@mailserv.cuhk.hk

5444. Re: WINX 2.1

Newsgroup: comp.sys.atari.st
Date: 1994-03-22 10:45:08 UTC
From: mm68@unix.brighton.ac.uk
Message-ID: <1994Mar22.104508.3514@unix.brighton.ac.uk>
Source record: 190595

The only problem I have had with using winx is that it will not recognise the AES 4.0 GEM.SYS. Gemram will load it, but winx does not like it.

The standard AES in ROM works fine though.

If you can afford Cubase Audio, you really should stretch to a decent sized HD if
you possibly can. 1Gb drives can be got for 5-600GBP ir cheaper than Cubase
Audio. I believe Cubase Audio only works on SCSI devices anyway.
Additionally, the new multichannel interface is now out which allows higher
quality sampling.

La> (shades/patterns)...

Since we (at Gribnif) have never seen WinX, we have no idea how it interfaces with Geneva (or even what it does). However, Geneva does let you manipulate any background windows without problems.

Any any standard accessory or CPX (we use Atari's own) you can change any of the window colors in any way you want. Geneva itself has controls for changing the 3D buttons (you can even turn them off and design a whole new bizarre look).

You have already 64 windows with Mag!X, you can already handle
inactive background windows, there is no "arrow bug" ...

So why use WINX with Mag!X ?

Ciao, Arno

I installed VRAM on my Falcon, which currently has onlt ST RAM and an IDE hard disc, and used GemView to unpack a 1225x757 colour JPEG file. It took about four-and-a-half minutes. After the first half minute the drive access light was on almost continuously.

This was of course a very cruel test, and GemView is pretty slow at un-packing JPEG files at the best of times (BTW does anyone know whether a co-processor would help here?). And I doubt the author of Gemview was worried about page-fault rates when he designed his code.

I can't say how long it would take to unpack the same file without VRAM, because without VRAM I can't unpack it at all! Not even after throwing out all my accessories and half my AUTO programs.

I did briefly try loading more TOS-style programs (MicroEMACS, etc.) into MultiTOS than would normally be possible, and the performance degradation was not too bad (i.e. still slow as a dog, but with only one lame foot :(). I'd be interested to try things like running gcc in ``pipe'' mode, with maybe a gnu Emacs hanging around as well, to see how this compares with running gcc in temporary file mode and no VRAM. When I get my SCSI disc and have space for things like recompiling gcc. Anyone tried this already? Erlingh?

Hi all!

I finally got around to trying to use GEMRAM 1.6 and ARROWFIX.PRG (that fixes the double-click for single-click bug in newer TOSes). GEMRAM installation seemed to go okay, but I get an "Installation Failed" message on the ARROWFIX.PRG. Is anyone else out there using these programs successfully?

Thanks,
Michael

Remember: MiNT != MultiTOS

> Come to think of it, what would Winx give you under MTOS that you
> wouldn't have already?

hmm? I don't have realtime sliders with MultiTOS. I cannot move or
resize the windows in realtime with MultiTOS. I cannot switch off
those ugly 3D scrollbars with MultiTOS. Backdrop does not work well in
MultiTOS.

WINX 2.2 has all these tings. In the next version of WINX it will be
possible to switch off the horizontal scrollbar in all NEWDESK
windows! Ey, that's great!

I'm sorry but I've to correct myself:
My Falcon HAS a bass boost, I thought it had not because that's what I
read.
Two days ago I messured the freqency response of my falcon.
The input is quite good, a little loss in the low frequencies.
But if I create a sinus signal in the Falcon go out through th DA and back into
the AD the result is really worse. A bass bost up to 400 Hz then quite linear
and after 10kHz it's starts to fall down.
I thought the sound of the Falcon is just bad, but this leaves some hope,
if I remove the boost the sound should be quite good, only some high
frequencies missing.

Well, using a "Spectrum"-like technique is one way to get 16 colors
in medium res. Another way (which I think ANSITERM uses) is to simply
switch to Low Res (automatically from ST Medium) and use the 16 colors
there (but since the resolution is 320x200, each character in an 80-column
screen is like 4-5 pixels wide). In this case, you don't get any
flickering, but the characters are a little tiny (not bad though on
a 14" monitor, though I wouldn't recommend focusing on it on a TV -
unless you have a big screen :-)

Actually it does allow presets using the F-keys and there shouldn't be a problem with .CPZ as well as this is XCONTROL not SuperBoot that will load the files. Give it another look. I am quite happy with this program.

Get real, buddy. Do you _believe_ translating is easy? It's very time consuming
to do docs and for a non-native speaker it is also very difficult to find the
right terms for technical stuff. Using a dic even costs more time.

Many of the shareware-programmers are students as well and they do have to
emphasize on that [at least sometimes ;-)].

Germany *is* the biggest market for Atari and does an
English/American/orwhatever
programmer even bother thinking about a German version?

Hmm, I dunno about LGS and Geneva (will have to unarchive it
and try it out). Geneva works fine with UIS III though. It does have
it's own file selector (which has some very powerful features), but one
thing it lacks keeps me from using it too much:

-you cannot delete a READ-ONLY file with it (unlike UIS III, where
you'd be prompted to override the flag)

This is bothersome for me. Certain BBS's which I download stuff from
send a "read only" status through Zmodem, and make the resulting
files on my hard drive read only. I need UIS III to mark all of them
as READ/WRITE (and I don't want to have to do this with a desktop
program which is more cumbersome).

Other than that though (and the fact Geneva and MiNT aren't
buddies yet <hint hint :->) Geneva is a very nice product, and rather
solid from what I can tell...

And besides, the "3D" look everything gets is pretty cool...

From: dvac@longs.att.com
Message-ID: <Cn2xIq.Ho4@bigtop.dr.att.com>
Source record: 190532

Well now I have a 520ST sitting around and would like to use it for all kinds of stuff, so I am in the market for a few things. If you have any of these and would like to get rid of it, let me know!!

- double sided 3.5" floppy drive
- 520ST Memory upgrade
- SCSI adapter and SCSI hard drive

If you got em, and want to sell em, email me!!

- Dan Vachon dvac@longs.dr.att.com

5478. Chroma 24 for the Falcon - Dead and gone!

Newsgroup: comp.sys.atari.st

Official fromn the authors, development of Chroma 24 for the Falcon has
now ceased and is not likely to continue.

This is officially from Steve Delaney in a letter, and gave the reasons
as an irreversible dispute between himself and Doug Little. No details were
given.

Howdy pardners!

To all the Scandinavians that prefer English and seem upset about
my message stating that German STs are *statistically* the most
numerous:

(My site here is very flaky so I might have missed some messages and
you might have missed my answer.)

If you read my original post carefully you will notice that I never
mentioned the word "preference" anywhere. (Remember also that I myself
am an English-speaking Canadian albeit resident in Germany.)

All I stated were *facts* in response to a message claiming erroneously
that the English STs were the numerical majority which is patently wrong.
That's all. We may "wish" and "prefer" all we want but that still doesn't
change the facts.

Please read messages carefully before responding. That's how useless
flames get started. Thanks.

> I think it's the same for the rest of Scandinavia, don't mix us up with people
> speaking German as a native language.

I don't! See above. "Can be sold" and "as well as" does *not* by any stretch
of imagination implies German is a native language in Scandinavia, only that
Scandinavians (1/3 according to you) are a potential market for a German
program. Give me some credit... Everybody knows people in Scandinavia speak
"Scandinavian"... ;o)

> I prefer English documentation.

As a native English speaker I might too, but I'm also fluent in German, very comfortable in Dutch, and get by in French. Anyway, *preferences* had nothing to do with the point I was making. My original post was in response to a statement that English language Ataris were "the norm" which is patently wrong and I just pointed out that fact without attaching any implications.

P.S. Betting is now opened on how many humor-challenged humanoids will misinterpret the "Scandinavian" language bit up there and flame me for it... :-)

You should try to low-level format your drive with an option to disregard the factory defect list. So _all_ defect sectors will be marked bad. The German SCSI-Tools by Julian Reschke have such an option. Julian is reading this group, perhaps he has an answer for you as well, although he's pretty busy at the moment. I don't know if ICD software is able to handle this matter correctly.

Maybe it could be the Falcon, but Henrik Houstrup tested a drive with auto
terminating as well, and there was no go at all on the Falcon. But it did
run fine with the ICD-adaptor on a ST.

Ditto.
Of particular interest, has JPEG been included? And Photochrome
is wonderful, but the GIF "squash/ select area" option was a bit basic-
has this been improved?

Duncan.

The latest word I've heard is that NeoDesk 4.0 will be a BIG step up
from 3 and will have lots of funky Geneva-aware features. Don't ask
me WHAT exactly 'cause I don't know!

As for when, the word on GEnie is 3 to 4 weeks.

Also, the upgrade for 3.x to 4.0 will be $25 plus sending in your old
disks plus shipping (?).

>

Well I may shed a bit of light about TAZ. I know the people responceable for this program and think that people who are interested in high speed should take a look at it. It is very fast but also only about 98% complete. The versions out right now are complete and running but there are a few things they are working on right now so it will be worth a few weeks wait to get the next revision. (Right now they are just finishing up Z-modem and a bug that causes the machine to do a perfectly clean exit to the desktop whenever the mouse gets turned off while NVDI is installed.)

> Clifton Mothershed!

Keith.

BTW: I know that at least two of the people who created TAZ are on the net.

Source record: 190545
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Triple Yahoo version 1.0, a new one to four player yahtzee dice cloan by Stuart Denman, was just uploaded to atari.archive.umich.edu. It is in Games and Falcon directories.

This addicting new game works on ALL atari computers in ANY resolution with ANY system setup, even graphics cards! The game uses over 130K of digitized DMA sound as well as all the perks of the new AES systems. It supports Speedo GDOS fonts, 3D buttons, color icons, and runs under MultiTOS or Geneva.

Everything is 100% GEM and runs in windows. The game is highly configurable from the color of the windows, to the type of dice you have. All with impressive sound effects and computer "comments" on your rolls.

This is a shareware demo version from StuSoft, so if you like it, you can register and avoid the shareware reminders. Please read the file TRIYAHOO.DOC included with the game for all information about registering, how to play the game, and info about all the different preferences.

Enjoy, I think this is the best game I've seen on the Ataris in a LONG time! Comments are welcome, let me know what you think!

Stuart Denman

I tried to install Winx2.1 on my MegaSte, but it wouldn't give me the
scroll-arrows in the corner, although I set the winx.inf flag appropriately.
Is there a problem with MegaSte's? Mine is an older one, with TOS2.5.

My sincere thanks to the people who replied about my Calamus querry.

I installed all the files, changed to monochrome mode and voila! It works great! I must have tried every mode but ST-high when I first tried running Calamus on my Falcon last year. It even works with screenblaster (the demo version) and I assume it will work with BlowUp030 in the monochrome modes. Does Calamus 1.09n work with NVDI as well?

Thanks again :):):):)

I haven't gotten the report from Atari yet (they're not exactly the most regular people in my portfolio), but you can rest assured that (a) overall sales are down, (b) overall profits are down - if they're pulling in a profit at all, and (c) they're promising (again) a "significant increase" in Atari's market share in the "near future".

I love a good joke, don't you?

Try setting your date to Jan 01, 2000 and then see if your files have that that correct date, although I believe that this does not apply to the
STE's.

ANSITerm is good, except that the dialer is just a little too basic for me..
Also, I've found it's ANSI translation doesn't work with the Uni's VAX too
well.. :-((Storm, doing VT-100, does nicely!)

> Trying to do Spectrum-512 type tricks with comms would probably not work
> too well. (Although, if Photochrome can do '32000' colors on an STE on
> a static screen, it _might- be possible to manage 16 colors on a
> 640*200 medium res' screen and use it, (although it'd be horribly slow!).

Photochrome does amazing things just on a plain ST! I would have thought given
what it was doing 16 colours in Med would be a snap.. I guess not.. :-(

> Why not a 640*200*256 GIF viewer? It'd make them look a bit better! :)

:-) I thought PChrome v3 did 4096 on screen? Anyway, a choice of colours from a
total of 24-bit would be nicer.. :-)

It does up to 4096 in 320*200 mode on an ST, and ~19000/32000 in 320*200
mode on an STe

Makes some pics look quite impressive!

If you really got the packages from ftp.tu-clausthal.de you should have
noticed the files 'readme' and 'readme.pkg' within the same folder
(/pub/atari/telecomm/tcpip/tuc-tcp). They include answers to your questions.

Nevertheless i will try to answer...

> So my questions are:

> 1) Does this software run over the serial line?

Yes and No: the current ditribution does not include a packet-driver for
the serial line. If you want to use the serial line (SLIP?) you have to
write a driver (see readme.pkg).

> 2) Anyone have a mail address for the author(s)?

...at the end of the 'readme' file:

For any suggestions, enhancements and bugreports send a mail to
Peter Mayer , pm@fortec.tuwien.ac.at

> 3) Does it run without a ReibelCard Plus?

Yes. But you have to modify the packet-driver. Another driver (to use with
DLink DE600) is included.

Bye,
Wolfgang.

M> of that plus a VT-100 emu and presto, a terminal programme.. :-)

Umm ... I really doubt that .. the 512 col trick uses almost all the CPU time, and there are errors which might be noticeable on such a low amount of colours as 16 ...

Since you have to hog the CPU during the synclock (when you sync the screen-raster with the CPU, thus being able to switch colours exactly where you want) ni interrupts will come through, and any form of serial transfer seems like a dead idea to me anyway ..

If anyone has solved this, excuse me for sounding negative .. .-)

Or use Uniterm.. that has VT100/VT102/VT220 and Tektronix T4010 emulation.
OK, it's not fully GEM complient and you can't have it in a window and it
only runs in ST-Med or ST-High modes, but it's the best terminal emulator
I've found on the ST/TT/Falcon, and believe me, I've tried them all!

>: but that does not work....
We already solved the problem by private email. But because more people may
have the same problem I'll post the solution:
When using our mail-server you should give path names relative to /pub, so
to get the /pub/ATARI-ST/INDEX file you send the message
begin
send ATARI-ST/INDEX
end
to mail-server@cs.ruu.nl.

In <2mcl5n$884@dux.dundee.ac.uk> dsime@mcs.dundee.ac.uk (David Sime) writes:
>In the directory pub/ATARI-ST, there is a file called INDEX.132
>This is probably updated and gets different extensions, but that
>was the current one listing the contents of the ATARI stuff.
Almost right...

The file /pub/ATARI-ST/INDEX is the index file, one line per package. Lines
are upto 80 characters long. The name of the subdirectory is on a seperate
line. This format is also used for the INDEX files in the subdirectories.
Example:
/pub/ATARI-ST/arcers
INDEX List of files in this subdirectory
arc.arc 900110 de c Arc archiver V6.02
arc.doc 910124 d c Manual for ARC
arc.ttp 910124 e c ARC archiver, V6.02

The file /pub/ATARI-ST/INDEX.132 is the same index file, but with the name of
the subdirectory on every line. Lines are upto 132 characters long (hence
the name INDEX.132).
Example:
arcers INDEX List of files in this subdirectory
arcers arc.arc 900110 de c Arc archiver V6.02
arcers arc.doc 910124 d c Manual for ARC
arcers arc.ttp 910124 e c ARC archiver, V6.02

I agree, that's what I did. Having been dissapointed with all the managers I looked at. I didn't like the user interface on Superboot, and since I don't like reading manuals...I didn't use it.

:(It's not good enough to release anywhere,
: but being DIY, you can add whatever you like to it, and Pascal actually
: generates _reasonably_ fast & compact code! Maybe if I can get it
: working 100% I'll release it!
Mine works fine, but doesn't yet have an options screen so all defaults are built into the prog, which is fine for me since I can recompile it to change them.

: (It does everything X-Boot 3 does (AFAIK),
Does anyone have a list of what X-Boot 3 does, then we can all add these features into our managers and never need to shell out 35 quid :->

:but doesn't have a non-GEM
: mouse driver like XBoot has (Tricky that bit!))
Yes, but XBoot is a stunning program. It's almost a false economy writing your own since the amount of time spent on it is probably worth more in monetary terms than buying XBoot.

But, the main reason I wrote mine was so that I could boot up in low res and use the manager in low resolution. Medium res on my TV sucks.

: I would say that is a LOT steep... My SM124 refused to turn on, too,
: so I went to the local good electronics store (Stark Electronics) and
: picked up a package of 250v 3A mini fuses and replaced the bad one.
: It took 15 minutes (10 to find the screwdriver!) and cost $2.45.

: Also, a used working SM124 can be had for $75 here on the net!

: .s.
: --
Sorry, but to get a trained technician to do the diagnostics and the
repair work -- $78 isn't bad at all. Maybe a touch above average,
but maybe not, for a minimum charge.

Buying the parts and installing them yourself is a whole different
matter. You can save a bundle if you know what you're doing, or
electrocute yourself if you don't & are unlucky.

5517. EVEREST 3.2 (english) is out

Newsgroup: comp.sys.atari.st
Date: 1994-03-23 09:51:00 UTC
From: Christian_Dalichow@ki.maus.de
Message-ID: <A51821@KI.maus.de>
Source record: 190474

Hi there around the world...

All I want to say is:

The english version of EVEREST 3.2 is out now!

EVEREST is "the simple and genial GEM Text-Editor" written by Oliver Schmidt,
translated by Joe Connor.

I don't know where you can get it, but have a look on it!

The archivename should be: EVER_E32.TOS (self-extracting zip-file)

For changes please read this text taken from EVEREST.DOC (translated by Joe
Connor):

Version 3.1 20-2-1994
-The Delete key after expanding an abbreviation works now correctly.
-WM_BOTTOM Message implemented.
-'The file ... does not exist. Create a new file?' -Message removed,
because it's unnecessary.
-WINX's Scrollboxes are now supported.
-Everest works now correctly, if the windows are moved over the left screen
border (under WINX).
-Two new menu entries in the FILE-menu: 'Save changes' and 'Close all'.
-The cursor column can be defined in the 'Sample Error messages' dialog.
-If GEM doesn't recognise the scrapdir, Everest takes the environment
variable SCRAPDIR.
-Because many people asked for more flexible cursor handling, it's now
possible to choose between text dependent and free cursor positioning.
-Optionally a formfeed can be send to the printer after printing a text.
-Everest can create backup files.
-You can save a marked block using the 'Save as' option.
-Everest supports the UFSL, a font selector that can be used by all
programs like a fileselector (UFSL = Universal Font selector).

Version 3.2 27-2-1994
-Unfortunately there was a bug in version 3.1, it was not saving marked
blocks properly. Hopefully this bug is now fixed.
-The English has been fine-tuned (Open file(s), Save block as, Save file
as) etc.

Oliver Schmidt and I hope you will have only fun with EVEREST.

If not: contact us!

so long, Christian

Christian_Dalichow@ki.maus.de
no message longer than 16kb, please!

DS> In the directory pub/ATARI-ST, there is a file called INDEX.132
DS> This is probably updated and gets different extensions, but that
DS> was the current one listing the contents of the ATARI stuff.

Both INDEX and INDEX.132 are present and have the same date/time stamp.
INDEX.132 is a 132 char wide listing with a little bit more info.

Am I the only one that can't get this bloody program to work?!?!?!

Maybe it's my modem? A GVC FM-1440VE ... I have managed to receive
a fax with the software made for Binkly Term.

Coma won't connect to send a fax, and it only receives a corrupted
unreadable page :-(.

BTW: I thought Hackfax was only for ZyXel modems? Maybe that's why
Roger can't get it to work? Or does he have a ZyXel now?

Craig.

From: rab2@ukc.ac.uk
Message-ID: <5746@raven.ukc.ac.uk>
Source record: 190478

To reply to myself...

I bought ST User anyway (because I enjoy the excruciating embarassment of buying a magazine with a cover that looks like it has been drawn by a disturbed 5 year old).

Photochrome version 4 now loads all types of Targa and runs happily on 16MHz Mega STEs. (It will also convert but not display on the Falcon, should anyone have such a desire. What's wrong with using Gemview in High Res TC?) No JPEG handling, and I don't think the GIF resizing is any different.

There's a new version of PCSVIEW which searches the directory it was run from, rather than just A:. PCSCLICK didn't dearchive properly for me, but I already have it from v3 and there as no mention of any changes in it.

As it is the "ST User Release" and says so in the program, I don't think it is PD as ST User will have paid for it. I hope there will be an official PD release soon so everyone can get it without having to suffer ST User...

For those of you worried about the demise of Chroma Studio 24, the PChrome4 docs mention a forthcoming amalgamation of PChrome and Chroma called Chroma Studio ST. Let's hope that one gets out of Floppyshop alive :)

Richard.

Eh? There are several C compilers available for the DSP. I can't vouch for the quality of code generated, but for quick-and-dirty routines, they may well be sufficient. I wouldn't use one, though!

PS Anyone got any experience with DevPacDSP? Any opinions on this?

I believe Project Gutenberg is actually an Internet effort, with this CDROM being a compilation of what is available so far. Thus, all this stuff is available via ftp, to my knowledge. I remember reading an explanation of the copyright issues (and it seemed to be fair and above water, but I cannot remember the details). Anyway, it should be easy to check, as the disclaimer should be pasted to the top of any PG document.

>is an infringement of copyright is it not?

Nope. I've been downloading some of these "e-texts" from
198.86.40.81 I think (in the pub/docs/books/gutenberg directory, I
think). The header in all the texts I've looked at says that the
books that they put in ASCII form are in the PUBLIC DOMAIN
(they specifically mention this).

I dunno what you meant about "reg. commercial group" but the above
statement should still hold (i.e. public domain texts)...

>Looks dodgy to me.

Check out some of the files from the above site and see what ya think?

>Mem-Watch is handy though :)

True. Works nicely under Geneva too :-)

I think that MultiTos should be viewed as a development tool, till they
actually get a useablr version out. It forces programmers to write programs
that behave properly and has done the entire Atari scene the world of good.
In other words, stop slagging it off till they get a 'proper' version out
that works at a good speed.

If you want I can send you my manuals for the F030. :-)))
I got my F030 in december 1992 with English manuals. Three months later ATARI Deutschland (Germany/I know that you can't speak German.:-)) gave me the German manuals and eight months later I got MultiTOS and SpeedoGDOS without manuals. You see, it must be a big problem for ATARI to produce manuals. Perhaps your dealer will get them some months later. :-(

>He did not tell me what manuals that were missing, but this does not

Message-ID: <01HAB3T30D5U95Q8PV@SNYONEVA.CC.ONEONTA.EDU>
Source record: 190489

Hi all!

Well thanks to those on the net who answered at least some of my previous questions!

Anyway, I've got more...here they go...

1) Way back in October I remember seeing a list of Falcon Software titles that were either available, under development, or proposed...

I'd like to know if an upgraded list of available "Falcon Only" software is floating around?

I'm interested in Falcon only games (commercial), graphics packages, and the like, etc.

So far...I've seen few of these products released and many others that never made it.

2) Does anybody know the e-mail address of the authors of the wonderful shareware painting package Crack-Art? Also, is the program still under development?
I've seen version 1.36 of Crack-Art but I'm leery of registering for it if a) the program is no longer under development and b) the program won't support Falcon and TT video modes, etc.

3) Why won't certain Falcon demos and Falcon games like Mini-F1 run properly on my Falcon030? Demos like PLASMA50 and INTEL cause my RGB monitor to roll vertically. Are there system fixes to correct for 60hz Vsync problems? Those old ST/Ste 50/60hz toggle programs that poke mem location $ffff820a don't work on the Falcon...

Any help will be greatly appreciated...Thanks in advance!

Ari

5533. Tweety Board Problem

Newsgroup: comp.sys.atari.st
Date: 1994-03-23 15:39:01 UTC
From: andy@ice.stx.com
Message-ID: <2mpnql$45u@paperboy.gsfc.nasa.gov>
Source record: 190490

I just bought a used Sound Off! cartridge, works great. My 520ST+ (TOS 1.4) has a Tweety Board installed (by previous owner), which has always worked fine with games and music sequencing software, but when I try to play back Sound Off! samples it sounds *very* distorted.

But when I save the samples to disk and run it on my son's 520ST (without Tweety Board), they play back just fine. When I press the AUDIO button in Sound Off! (not explained in the manual, but would seem to pass sampled input directly to the sound chip/output) it sounds like the levels are very high and you hear a lot of background noise and hum, almost like an impedence mismatch. When I disconnect the input to the Sound Off! cartridge, nothing, just quiet.

But I don't think the problem has anything to do with Sound Off! I opened up my ST and looked for any obvious hardware problems with the Tweety Board, but it all looked fine. Tested it with other software, sounds fine, maybe too loud. A PD speech program was pretty distorted.

Does anyone have any ideas or suggestions on what the problem could be, or how I could get the output of the sound chip clear and useful to mix back in with my other music (I'm basically looking at using the ST with the Sound Off! cartridge as a poor man's sampler!) THanks...

You can use Compose (freeware, by Pascal Fellerich) to install another keytable. With MagiX you can't run Compose from the autofolder, you have to start it as an auto-application (or manually). I'm using MagiX with an American keyboard, no problem when Compose is installed (if necessary you can create your own keytables).

> Is there a problem with MegaSte's? Mine is an older one, with TOS2.5.

I'm using WinX 2.2 (don't know if it is supposed to make a difference in
this respect) under TOS 3.06, with the following flags:

```
# Globale Schalter
.GLOBAL = 1+ 2+ 3+ 4+ 5+ 6+ 7+ 8+ 9+ 10+ 11+ 12+ 13+
# Lokale Schalter
* = 1+ 2+ 3+ 4+ 5+ 6+ 7+ 8+ 9- 10+ 11- 12+
```

The local flag 9- is responsible for a decent placement of the
sroll-arrows, works fine for me.

>Falcon IDE with 4 pins being dedicated to power, and if so, what pins are what>- don't wanna connect a +12V to a data line 8*() .....

Hi!

I connected the original MegaSTE internal Hostadapter to 520ST's DMA port
using the following plan (I have it from Stephan_Kilian@k2.maus.de)...

```
5V 30 O O 29 GND
5V 28 O O 27 GND
5V 26 O O 25 GND
N.C. 24 O O 23 HDINT (10)
(19) HDRQ 22 O O 21 RW (18)
(16) A0 20 O O 19 HDCS (9)
(14) HDACK 18 O O 17 Reset (12)
16 O---O 15 D7 (8)
14 O---O 13 D6 (7)
Datalines 12 O---O 11 D5 (6)
from DMA-Chip 10 O---O 9 D4 (5)
8 O---O 7 D3 (4)
6 O---O 5 D2 (3)
4 O---O 3 D1 (2)
2 O---O 1 D0 (1)
^^^
```

those lines are the jumpers in Mega STEs without internal Harddisk

numbers in () are the pinnumbers on the DMA Port (the external one)..

Dear ST Chums.....

I am going to be testing a NEW high density disk drive module for the ST.

The company concerned is in the UK, and I would appreciate it if someone would
sell me one of the HD disk drives...

Thanks..

Hope to hear from you soon.

Danny.

I disagree. MultiTOS is sold as a product. There is no mention that it is
a development tool. I agree that its availability has has forced
programmers to write 'properly' and that's good.

>disappointment, this slow SCSI-II port on the Falcon!

Used RateHD to measure, eh?

I don't know how often I posted this: RateHD's results are bare nonsense on Falcon and TT SCSI ports. I've seen drives that definitely fly at 1800 KB/s, tested them with RateHD and got something like 900 KB/s. This sucks :-)

>fear or favor that PageStream loaded quite noticeably faster on my old
>setup than it does now on this 32MHz Falcon. I find myself agreeing

Sure - the more memory Pagestream gets, the slower it loads. Don't know why, but our DTP workstation (TT, 12 MB RAM, 200 MB Conner HD) takes AGES to load PS.

5552. Help needed making sound on ST

Newsgroup: comp.sys.atari.st
Date: 1994-03-23 18:55:00 UTC
From: dud@cbnewsf.cb.att.com
Message-ID: <Cn4sJp.Bor@cbfsb.cb.att.com>
Source record: 190409

I have an early 520ST, upgraded to TOS 1.4, 4Meg, 80Mb disk, that I mostly run in mono mode.

Is there a program that will play MOD, WAV, and other sound files on my Atari? I have copied some programs off of atari.archive.umich.edu, only to find that they seem to only be for STE's, or only run in color. (What the hell does color/monochrome have to do with sound reproduction???).

Can anyone recommend an ftp'able program that will play sound files on a mono Atari ST? Please give me, if possible, an exact file name. I can always search through 0compind to find where it lives on umich.

Also, would someone make an attemp to define some of the sound file jargon? What does "tracker" or "noi[sz]etracker" mean in this context? How many sound file formats are used on ST's?

I understand that MOD files are sampled sounds from Amiga land.
I understand that WAV files are sampled sounds from DOS/Windows land.
I understand that DOS/Windows has midi data files as well (.MID?)

Thanks in advance.

Hi!

>I've used HowFast1, but wasn't sure how accurate it was. Some of the
>results were a bit anomalous. For example, on a 340 meg Quantum SCSI-II
>drive attached to a Falcon, it reported read rates maxing out at ~1.8
>MB/s. Testing the same drive on a Mac reported rates ~2.8 MB/sec.

How-Fast measures real world file access, not raw transfer rate. This will
always be slower.
First, the Mac tool might measure raw rates. Second, the more expensive Macs
have more expensive SCSI controllers, which might be faster than the Falcon's.

> I know the DMA port on at least the Mega ST's was bandwidth limited to
>a maximum of 1.4-1.5 MB/sec. Does the Falcon have a similar constraint
>at 1.8 MB/s? I.e., the drive can do much better, but the Falcon can't?

Sure the system has a constraint here, but I haven't hit it yet. The SCSI chip
can do about 4 MB/s raw transfer speed according to its manuals, that should
give about 2.5 MB/s max file read throughput.

>Is there any variation in HD speeds caused by loading from video
>refresh? That is, do HD transfers run faster at the less intensive ST
>modes than in the 256 color (and true-color) modes, just like the CPU
>runs faster in those modes due to less bus contention?

SCSI transfers won't get slower. IDE transfers will. Strange but true.

> I also vaguely recall that when I tested an older drive (an LPS240)
>that I had gotten rates ~1.2+ MB/sec with both RateHD and my own
>benchmarks on a Mega ST, that HowFast1 maxed out at ~900 kB/sec. Since
>I couldn't read much of the German documentation, I wasn't sure if there
>wasn't something I was overlooking. Plus, the Write rates were always
>significantly lower, which seems strange unless a verify pass was being
>done?

See above. RateHD measures raw transfers, How-Fast writes and reads GEMDOS
files.

GEMDOS takes more time for writing a new file than for reading one. Creating a
new directory entry takes longer than finding an existing one.

bye, Peter

How could they!!!

I understand if there was somekind of argument between them, but what i don't
understand is, that not one of them is continuing the job.

Well, so much for this great Chroma, and so much for our Falcon's 8-(

Marshall (G.M) Harris was heard to mutter:

> I know it has been said before, but it may be worth repeating the following
> for the benefit of dummies like me:
> what are the benefits/disadvantages of pre-emptive versus co-operative
> multi-tasking?

Okay... co-operative multi-tasking. You have an event scheduler that says "your turn" and lets a task run until it is nice enough to say "I'm done" and return to the scheduler. The scheduler then tells another routine "your turn".

The problem with this is that if one task decides to lock up due to a logical flaw, or is just plain rude, it can hold onto the processor forever, and take down the whole machine.

Pre-emptive. A schedular lets a task run. After a given amount of time, it interupts the task, completely saves it's execution state, then resets the execution state of another task, letting it run. After a given amount, it interrupts that one, saves its state etc... Disadvantages, all tasks get the same amount of time, wether they need it or not. Advantage, a task can lock up or infinite loop due to a logic flaw or other error, and it will not slow down the other tasks or cause a halt to the system in any way. If a task offends somebody, it can be completely killed with little adverse affects (assuming it hasn't grabbed stuff it shouldn't -- on processors with protected modes to multi-task in, this is relatively safe).

The real nice thing about co-operative is that things that don't do a lot, take less system time, those that need the time get it. The bad thing about is that a task cannot make any assumptions about process time, or do anything requiring accurate real time response. By setting up rules about how long a task can take before handing control back to the scheduler, this can be avoided, but it is a pain to deal with, and there are no guarantees that a rule breaker won't cause other tasks pain.

TAZ is in a state of flux right now. I've just added internal Zmodem (in assembly, blech, but quick) and I'm getting some bugs out, and Daryl, the other half of the team is working on a more proper vt100 emulation. Not perfect until we completely re-write the screen system, but much better than the ANSI only mode offered now.

The practical upshot is that we could send you 1.00, but it is lacking decent Zmodem and vt100, and 1.10 won't be ready for another few weeks yet. We hope to get the new version on the umich FTP server when it comes out, in the mean time you (or anyone else interested) can email me to get a copy of 1.00 if you're still interested.

HOWFAST version 1.0..

Is this the latest version..??

Also can some one post the Info that is
on the screen, Translate it, Thanks.......

I just had a play with RateHD V3.07 and it gave me
1200k with my 240m Quantum LPS..

This was run from the DeskTop with very little TSR's
and No ACC running, I don't know if this helps..

I then run HOWFAST, but that gave me some 900k and
about 200k Writes...

I then had a play with the Options, Block Sizes, what ever,
it was then going up to 1000k read, I then uped these Block
settings, I was getting about 1100 Read, and then there was
a Dialog Box stating some thing, I think about Run out of Disk
space...

So Can some one do a little translation of the Mail Sceen
so that I know what all these Block options meen....??

Or better still a translation of the Doc's...

Thanks......

IN>The local flag 9- is responsible for a decent placement of the
IN>sroll-arrows, works fine for me.

I stopped using winx becourse not all software seems to like it e.g.
when exiting 7-Up or Interface several error messages do apear
before returning to the desktop without problems.
Can anything be done about this by setting particular flags?
It is a good enhancement of GEM though. Maybe Atari should
think about an agrement with the creators of winx to use some of
its code.

BOAST file number 2 has been released upon the world!

I had MUCH positive feedback about #1 (hd_free CPX)! Thanks for all
the kind words!

Wincolor (wincol_e.zip) is a CPX for setting not only the topped
window's gadget colors but also the colors of window parts which are
hidden and those of the untopped window! it apparently also works
very well with Geneva! The CPX is self-configuring as far as language
goes, meaning you can run it on just about any ST in any language and
it'll use that language! Neat! Get it! Love it!

.s.
(it'll be uploaded to GEnie today or tomorrow, too! I'm s.foskett
over there...)

|> "MacSEE" - and I *think* (someone double-check on this) that it
|> only supported Mac HIGH density disks?

That's correct. MacSEE cannot emulate a variable-speed floppy drive
the way Spectre GCR can. This eliminates the possibility of reading
Mac double-density floppies. However, one side benefit of MacSEE is that
it allows you to copy Mac HD floppies to your Spectre hard drive
partition. _That_ is something the current version of Spectre cannot do.

Incidentally, I was once told that it is possible to format a
Mac double density floppy in a 720K format similar to the 1.44 Mb
Mac format. Those non-GCR 720K Mac floppies would allegedly be
readable by Macs and Spectre alike. Anyone know if this can really
be done?

>-scott tirrell
I am running NeoDesk v3.04 quite successfully on the Falcon (TOS 4.04). It works fine in all resolutions (including the expanded resolutions that I am running with BlowUp Hard I). Neodesk not look as pretty as the NewDesk desktop (icons are two colour only), but the functionality makes it worthwhile. Installing ICD Pro instead of AHDI, and using NeoDesk instead of NewDesk, makes a vast improvement in file manipulation times.

The one difficulty I had with NeoDesk is that it requires a separate configuration file for each resolution. As (via BlowUp) I have a different resolution for each colour mode, I had to maintain several configuration files. The solution is to define NO config files, and allow NeoDesk to use the DEFAULT config. Just save to DEFAULT.* instead of NEO*.*

The only Civilsation version that I know which corrests several bugs is a cracked version: it works perfectly on Falcon. Now, you've got the choice: copy a cracked version of a prog which doesn't exist on your computer, or buy it, knowing you won't be able to play with. Now, if you've got the original version, you can "upgrade" to the cracked one...

Source record: 190356

Computers tend to depreciate in value more than most things (i.e. cars).
The reason is simple - technology. A $10,000 PC-AT bought in 1984 might
be worth $250 or less in today's market because of the availability and
low cost of newer, more powerful machines.

As a general rule - computers tend to depreciate as much as 50% of their
original value - no matter how good they are maintained, etc.

Now, esoteric machines (like the ST series) will depreciate even more because
there is less demand for them.

There is a glut of used 1040Sts floating around and so they are not worth too
much. However, if the market is there - as for a STacy portable - then this
machine might fetch the seller's price.

Newer machines like the MegaSte will fetch more used because they are newer but
don't expect to get anything near their original value.

Now, if you sold $2000 worth of hardware and the buyer agreed to pay you this
sum - the hardware is still worth the $2,000...

Ari, in the case of Mr. Nelson, the best way to determine the v

Hi All

A long time ago someone asked for new icons for the TOS 2.09.
Yesterday I got a great libary of icons from my BBS.
There are thousands of icons inside and it includes an archiveprogramm for
those
icons.
I uploaded it today on
ftp.germany.eu.net (192.76.144.75)
I think tommorow it should be in the following directory
/pub/comp/atari-st/utils
The name of the programm is
big_icon.zip (or bigicon.zip)

Now all wishes of icons should be solved!!

That's quite simple!
Format a disc on an IBM maschine. Your Atari is now able to read and write on
this disc. By the way there're some progs out to format IBM-discs on the Atari.
The Amiga is also able to read and write IBM formatted discs, so you can
transfer
your files to an Amiga on that way, too!
I don't know anything about MACs, but it should also be able to read IBM
discs.

It seems very good, you can create the 3 different file formats with it
.lod .bin .p56 (I think thats them)
and the debugger looks good, nice interface.

Unfortunately I haven't learnt DSP yet, so I can't really give you good
review!!!!

ps

Can you tell me how to interface c with DSP?

pretty please.

Tom.

Hello,

I am wondering about a program that lets one download all of the newsgroups that they are interested in, ans mail to I think, and then read it and respond to it offline, then the next time that one calls up again, the responses, and mail are uploaded. You also get the new batches of newsgroups to read.

I saw this type of program at a user group meeting once, but I am unable, as of yet, to get a hold of this person. If anyone knows of a program that can do this, please let me know. I also remember him saying that he had to get a thing set up for some one to give him newsfeeds.

Thanks

Joseph

Paul,

Csound is a digital synthesis engine that runs on various computer platforms.
I have seen Mac versions, and I think there are PC versions out there, but
I have yet to find an Atari ST version.

In the message I replied to, someone stated that programs that come with German documentation can be sold in Scandinavia ... by experience I'd like to say *NO WAY*

English documentation however is no problem.

It's called Petra

A STE-DMA sound emulator for Paula. Should be available where Paula is. It could even be that it's all packaged together in the most recent versions.

The one Tweety board system I have seen could not play samples at all.
They just sounded like white noise. The owner seemed to think that this
was normal (he rigged up a switch to "unsplit" the audio channels back into
one, through his amp).

|> the mouse :[). Earlier versions didn't do this, but had other problems.

Are you using multitos ?
I believe there are some troubles with minixfs and the multitos1.01 AES. There
is a patch which includes increasing the stack on the update process. I don't
remember the details, but ask Steve Henson for it.

I now have 1 partition of 165 Mb and one partition with 196 Mb installed as
minix filesystems on external SCSI disks. I haven't tried minixfs on the
internal IDE disk, but I can't see how this should make a difference.
Are you (***btw***) using AHDI ?

Paula with Petra should be able to, but you should still look for a dedicated mod file player (Paula is a background player). They should be out there.

> Is there a program that will play MOD, WAV, and other sound files on
> my Atari? I have copied some programs off of atari.archive.umich.edu,
> only to find that they seem to only be for STE's, or only run in color.

I use Protracker ST with a color monitor, and it is great! I did this for a long time on my Mega2ST, and now do it on my MegaSTE (DMA stereo sound, much better).

> (What the hell does color/monochrome have to do with sound reproduction???).

This was once explained to me in the following way: ST mono monitors run at 70Hz, which leaves less CPU time for other things (like playing MODs). You will note that most demos run in 50Hz mode instead of 60Hz, to gain more cycles. Thus, if one were to design a tracker, 50Hz color makes sense.

Of course, the things that one might want music for are also mostly in color (though I *LOVE* using Paula to play mods in the background while modeming and such).

> Also, would someone make an attemp to define some of the sound file jargon?
> What does "tracker" or "noi[sz]etracker" mean in this context?

A tracker (and any variations therein, Protracker, Soundtracker, Noisetracker, etc.) is a program that can play and edit sound module files (mods). These were originally developed on the Amiga, and consist of a set of samples (instruments), and sequencing information to play those samples. Thus, one can have nifty sounding music by "playing" it, as opposed to a huge straight sample of the stuff. Also, much work has gone into making mod players that use as little of the CPU as possible, so graphics and other calculations can occur while playing nifty music (sometimes called module routs, as in module routines).

For more information on these, grab the module introduction in the Falcon directory on atari.archive.umich.edu. Also, there are gazillions of mod files on wuarchive.wustl.edu (systems/amiga/aminet/mods/*, these are mirrored from somewhere else).

> How many
> sound file formats are used on ST's?

There are lots of module formats, though the Amiga Protracker seems to be a predominate winner (there are several versions of that standard, though). Protracker ST is the best tracker I have found for the ST and STE. I am anxiously awaiting version 1.3 from Norway right now, in fact.

Now, as far as sound file formats go (as in files containing single samples), there are lots. Grab a copy of Sound Lab from atari.archive. It works wonderfully in mono or color. It can read and convert several different formats. Also, there is a conversion utility called sox that supports lots of formats for different architecures.

> I understand that MOD files are sampled sounds from Amiga land.

More than that. Samples and sequencing info all in one, with special effects thrown in. Also, folks write mods on several different types of machines.

Assuming that the disks are not weirdly formatted, the clone (should) be
able to read them. Then again, they might not. If the Clone will, then
the Mac will with Apple File Exchange, and the Amiga will with
Cross-DOS..

Hope that helps!

Cheers!

5640. Atari floppies: Readable by Mac?

Newsgroup: comp.sys.atari.st
Date: 1994-03-25 00:16:13 UTC
From: joeclark@scilink.org
Message-ID: <Cn7232.1vs@scilink.org>
Source record: 190393
Cross-posted to: comp.sys.atari.st,comp.sys.mac.hardware

Hiyez. My pal has an Atari ST and will be upgrading to a Macintosh PowerBook as soon as I find one I think he can use :-}. He has many ST floppy discs. Can they be used in a Macintosh SuperDrive, which reads and writes Mac, DOS/Windows/OS/2, and ProDOS discs? I seem to remember that ST disc format is the same as DOS's. Is this true?

Thanx.

Theoretically you could have archie do the search for you. This works fine for me when I'm looking for Unix stuff. It doesn't work at all for Atari software, the archive maintainers seem to prefer acronyms instead of usefull filenames.

To find out more about archie send mail to archie@archie.funet.fi, with the word "help" in the message body.

>(the one with two floppy drive icons only). Should I worry about this?

Based on my experience of fitting 2 SCSI drives and a CD-ROM on a MSTE,
my advice is to stick with whatever *works* and not worry too much about
what the manual says.

OTOH in cases like this test it very well before commiting it to serious
day to day use.

Roland.

If you have DEVPAK ST (the assembler developer system), using the 'V'
option (View Other Screen) should also wrap the screen. At first I thought
it was just a Minix problem, but after finding DEVPAK did it as well, I
had the shifter chip changed under warrenty - and haven't had any problems
since.

5645. IMHO

Newsgroup: comp.sys.atari.st
Date: 1994-03-25 00:53:22 UTC
From: john@albemuth.equinox.gen.nz
Message-ID: <Up-ECZNEFUQ@albemuth.equinox.gen.nz>
Source record: 190398

Hi,

All this talk of IMHO (In My Humble Opinion) reminds me of another type of IMHO: IMHO the Offline Reader by Ian Print of the U.K. which handles QWK packets.

I've never seen this on any FTP site anywhere. I have a copy of version 1.03 but I believe that there is now a version 1.06 or 1.07. Does anyone else use this?? Can anyone point me towards a FTP site with it on?? Could some kind soul in the UK with Atarinet/Fidonet access find it and upload it to a FTP site somewhere??

Any help or comments would be appreciated!!

Thanks in advance.

5651. QUESTION: what decompression prgs to use?

Newsgroup: comp.sys.atari.st
Date: 1994-03-25 06:04:13 UTC
From: hallvart@ifi.uio.no
Message-ID: <2mtust$lp9@holmenkollen.ifi.uio.no>
Source record: 190308

I've been using 'DC Extract' for quite some time now, and like it very much as opposed to the command level type programs, and the fact that you normally have to use dufferent programs for different types of compression standards. All was well until I found out that it didn't decompress all programs properly. Sometimes it just won't decompress programs and it looks like the compressed program was the problem, but I've tried a few of these 'problem programs' and they worked well with other decompression programs, and someone suggested that 'DC Extract' might be a little too old for the newer decompresssion standards.

Now, my question is this: is there a similar program to 'DC Extract' that handles several compress formats and uses GEM, so I don't have to rememer all those commands? I need some program that takes all standards: .LZH .LHA .ZOO .ZIP .ARC
Thank you very much.

Hallvard, Oslo, Norway (hallvart@ifi.uio.no)

>>Gemulator for sale.

>What is a gemulator?

Its a device to turn a PC into an ST (rather like the Spectre GCR for Mac emulation on the ST.) Since it cost around UKP400 and turned your expensive 386+ PC into something resembling a UKP200 ST1040, it didn't sell a bundle. Hope this helps.

Cheers

There is NO reason why Cubase should not work without these files.
They are only loaded at startup if they exist. You can create your
own or update them simply with the 'save' command.

What version of Cubase are you using? Is it a cracked copy?

You can. At least in my version of the 6.2.3 booter, look for the bytes
$06B900000258000071E4
^^^^
$0258 = 600 = 3 * 200 = 3 seconds delay.
Insert your favourite value here.

It was either ST Review or ST User last month - I got a copy. Of course,
now I've got room to run gcc and g++, so.... Prospero worked okay for what
I tried.

If you have ftp access to the net, then you can connect to an
atari.archive.umich.edu mirror (I'd suggest nic.switch.ch as one option)
and go to Programming and grab the Sozobon C 1.33i or 2.0 distribution - it
works well on a dual-DS/DD disk, 1Meg setup with the Gulam shell, which is
also on the archive (Sozobon 2.0 and 1.33i provide instructions for DS/DD
drive setup). You'll also need GEMfast and Dlibs libraries (these may or
may not be in the distribution you pick up of Sozobon).

Have fun! - Bob

I'm afraid of _buying_ fax software for the ST. I fear that i'll spend
a heap of money getting something in from overseas only to find it doesn't
work.

5674. Atari BACKUP -> MSDOS RESTORE?

Newsgroup: comp.sys.atari.st
Date: 1994-03-25 18:33:41 UTC
From: swhatley@blkbox.COM
Message-ID: <2mvaq5$hkt@blkbox.blkbox.COM>
Source record: 190331

I am trying to transfer 1 Meg files from an ST to a IBM PC. My ST only has a 720K floppy drive. Is there a program to allow me to backup files from my Atari onto PC formatted 720K disks which can be restored using the MSDOS RESTORE command. Or, can TAR do it as well. If TAR is the route to go, how do I do it and what versions do I need on both ends.

Thanks,
STeven Whatley

P.S. Formatting the PC disks is no problem. It's just the transfering.

> Thank you very much.

You could try to use one of the multi shells, but I find that the following
works best for me. All are installed as applications, so I just have to
double click on the archive to process it:

arc - Arc 6.02, and Arcshell 3.1
lzh/lha - lharc 2.99, comes with an excellent GEM version
zip - STZip 2.4, GEM user interface
zoo - I use the command line :-). There are shells out there for it, but
I'm too lazy to find one.

It appears that lharc and zip (the two biggies in the ST world) will have
their own graphical interfaces from now on.

You pointed out the best strategy: replace the fan. Also, tighten up the
mounting screws, to make sure they are not contributing to the buzzing.
Wafer fans run from "cheap and noisy" to "expensive and quiet", so get a
good one.

Anything compiled with a later version of PureC is supposed to take advantage
of the FPU if it is there. Gcc binaries will also make use of the FPU,
given that the correct libraries were used in the compilation. There are
a definite sprinkling of programs out there that use the FPU (Dynacadd
comes to mind, as does one of those raytrace programs).

If you want to test your 68881, grab Gembench 3.1.

This might indicate that your machine has a HD disk, but no AJAX floppy
controller. There is a dip switch or jumper inside that you can set to
give it a try (and some PD HD formatters on atari.archive, I think).

The manual is pretty worthless. If there is some specific info from it you need, I might be able to help.

> Also, could someone please tell me how I would find out which TOS my
> machine is running?

Grab a copy of Gem Bench, I believe it tells you.

On the other hand, there are only a couple of possabilities, given that this is an unmodified Mega2. From the desktop, under "DESK", click "DESKTOP INFO" on a color monitor. If you see moving colors on the atari symbol, you have TOS 1.4. If not, you have TOS 1.2.

For TOS 1.2, the copyright dates listed for GEM are 1986, 1987. For TOS 1.4, I believe they are something else. Hope that helps.

> Lastly, I am asking over here since I didn't get a reply on
> c.s.a.st.tech. I would like to network my ST and my PC together so that I can

Well, anything is possible, but it would be non-trivial. I know of no way to do this with any canned software or product.

> If not is Word Perfect
> available for the ST so that I could just file transfer and print from the ST?

It is available, but no longer supported. I think the last version was pretty robust and bug free, but I cannot comment from experience. I see it up forsale occasionally. Toad might be able to help (1-800-448-TOAD).

I agree with your perception, and I 'only' have 8MB of RAM on my TT. I
remember one of my fellow user group members saying several years ago
(before I even had my TT, much less PageStream) that PS grabs all the
RAM it can get - the more you have installed (and free), the more it
grabs, and (I don't know why either) the longer it takes to load. It's
not too awfully long on my TT though. And it sure RUNS great on the TT!
(Now if I can just find a free ACC slot for one of those scroll-button-fix
programs...)

5691. Blowup Demo Question

Newsgroup: comp.sys.atari.st
Date: 1994-03-26 07:33:52 UTC
From: aspect@cats.ucsc.edu
Message-ID: <2n0oh0$sbk@darkstar.UCSC.EDU>
Source record: 190348
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I just discovered something weird with the BlowUp demo. When I set
it to 40 columns and line doubling on in the 16 color mode, my screen size
stays at the 800 x 480 I set it to, but the system font uses the small
8 x 8 size, and all my window gadgets are small! I happen to like this a LOT
and am wondering, does the commercial and Hard versions keep this "feature"?

~Chris

5692. Atari Jaguar Raffle

Newsgroup: comp.sys.atari.st
Date: 1994-03-26 07:50:43 UTC
From: umcordes@cc.umanitoba.ca

Here is your chance to win an Atari Jaguar!

The Atari ST Users Group of Winnipeg is holding a Jaguar raffle to raise funds for various club improvements and to participate in a major computer show. The tickets are $2.00 each and only 2,000 will be sold.

If you would like to enter the raffle please send a money order to:

Atari ST Users Group of Winnipeg
5-390 Carpathia Road
Winnipeg MB R3N 1Y4

Phone: Reg Loeppky 204-488-7183 for more info.

The draw will be conducted at our Annual General Meeting on May 12, 1994. The announcement of the winner will be posted to GEnie, Internet, FidoNet, and AtariNet.

Be sure to send in your order at least 2 weeks before the draw. If the tickets sell out we will return your payment.

Don't miss out on this chance win your own 64 Bit Multimedia Home Entertainment System.

Lottery License #031525.

>>in color mode saying 'Mono only' on the 'title' screen!
>Na, Steven some one must be colour Blind...:-)...

There are several versions of ledpanel. The original version (1.0) which
was also published on an ST-FORMAT disk is monochrome only. That one had me
going for a while. I'd been serriously considering the use of a disassembler
so I could modify it to work with color.

No longer. I got ledpanel 2.4 from some German ftp, and it supports color,
different shapes of the lights, shows date/time capslock etc if you
configure it that way.

Very nice, and miles ahead of the first version.

No!!!!!!!!! I pay child support for 3 kids already. I don't need another
kid to support!

>T0-day my ADspeed arived, it took 2 months to replace via
>Air-mail..

If you sent a check they waited until the funds cleared thats 2-3 weeks.
ICD's bank to mail your bank and your bank to mail to ICD's bank.

Money order; ICD's bank waits for your funds to clear 2-3 weeks.

I sent cash in sterling to UK for shareware, they sent the program
within 4 hours of receiving the letter but it still took 10 days
for my letter to get there and 10 to get to me once it was mailed.

>It only took 8 days from the USA to get to me, so how can it
>take some 6 weeks for them to replace it...
Perhaps they were waiting for new units to arrive.

I do know that they went to the Sacramento Atari Group EXPO
March 12-13, and they did not return to the office until 15 March.
I beleive Howard Peters is the only person who handles Atari
support at ICD.

>Plus I never recieved any replied to my E-Mails or Fax...

Send me the Internet address and I will try it to see if it is still in use.

>Not a good service do you think....???

I have had no problems with service but I am closer than you.

Not v2.12 on a.a.u.e but anyway Rick has it on "What's the Point" now
anyway. I guess it was hatched into AtariNet. It looks quite good,
though I'm not sure whether I'm convinced enough to use it regularly.

5704. PC-Ditto and hard drive access

Newsgroup: comp.sys.atari.st
Date: 1994-03-27 17:04:03 UTC
From: ap748@cleveland.Freenet.Edu
Message-ID: <2n4ea3$jj7@usenet.INS.CWRU.Edu>
Source record: 190261

Hello,

I just got a Stacy recently. I decided to dig out my old copy of PC-Ditto Version 3.0 and try and load that on the Stacy in case I needed to run PC-DOS when out on the road. I have used PC-Ditto in the past on a dual floppy ST1040 and it worked fine but I never tried it with a system with a hard drive. So I loaded PC-Ditto on the Stacy and configured it for what I have. I have it set up to boot off of floppy and not the hard drive I just want to get it to work plus I don't plan on doing any major PC-DOS work in the first place. I tell in the configuration file that I have a hard drive attached and that I don't want to ignore non GEM partitions. (There are none on my system anyway.) When I boot into PC-DOS (I'm using IBM PC-DOS ver 3.3) the system boots DOS off of A: fine but if I try and access the hard drive I get "Divide Overflow" message. Basically I can't access the hard drive at all. I tried using the supplied device driver PC_DHD.SYS in the CONFIG.SYS file to access logical drives D: and E: but when it reads that statement it says something like "Sector Size to Large".

Here is my systems stats.

STacy 4
4 Megs of Ram
50 Meg HD partioned as C:=17meg D:=17meg E:=17meg
SCSI address : SCSI=0, LUN=0

Basically nothing that I can tell from PC-Ditto docs is out of the norm. Any help would be appreciated. Please respond to me E-mail address because I normally don't get to scan this section often.

Hi all, well I'm currently learning C using Ian Lepores Heat & Serve C. Its pretty good, simple to set up but I am learning from a book called C Primer Plus, and this book just has a bunch of examples which are ANSI C and some of the stuff doesn't work on it. Is there a PD/Shareware ANSI C compiler for the ST? I have heard many people using GNU C, but don't know if it is C++ or ANSI C, or if it makes a difference. Would GNU C work for just learning ANSI C? If theres another one I could get please let me know.

My configuration is as follows:

ATARI 1040 STE, TOS 1.62 4 Megs
200 Meg HD

Thanks,

alberto@terapin.com

It certainly isn't illegal in the USA. Extremely ill-advised, but not
illegal. I certainly can't think of any reason WHY it would be illegal, other
than another thinly vieled attempt to control how we spend our money.

I'm curious as to how the Norwegian authorities (or US authorities, your
comment isn't clear on this point) KNEW there was cash in the envelope.

Hi John. If you have acces to someone who have AtariNet, i think you'll
find IMHO on their system. If not try call Kevin Osborne at the Forstress
BBS. I'm sure he have it.

Otherweise call my board +45 43717075 8-)

From: am136@FreeNet.Carleton.CA
Message-ID: <CnCLBB.JGI@freenet.carleton.ca>
Source record: 190275

In a previous article, alberto@terapin.com (Alberto Fonseca) says:
+I have heard many people using GNU C, but don't know if it is C++ or ANSI
+C, or if it makes a difference. Would GNU C work for just learning ANSI C?

GNU C supports ANSI C very nicely. (An ANSI-compliant C compiler defines
the macro __STDC__ to be equal to 1, and GCC does.) G++ (GNU C++) is also
part of the package - depending on where you get it - but you don't have to
install it.

GCC supports various command-line options which allow you to compile
"traditional" C, or only programs which adhere strictly to the ANSI
standard, but it will compile strict ANSI C as it stands.

Hi Folks ,
Have a question here someone may have come across before.
(This is for a friends set-up). He is running a Moniterm 19" (194 Model)
high res mono screen on a Atari Mega. He has had some problems running
some applications on the big screen and was recommended to get a program
called "xmon" (Written by a Don Wheeler ?). This apparently centres any
programs to the screen allowing them to run like on a 14" screen. I've
tried to find the program on the ftp sites but as yet have been unable to
find it. Does anyone know of where I might find this program or any
similar programs which do the same thing (Preferably via ftp).
He has been running bigmon but it does not seem to work with
programs wanting to see a smaller monitor. Bigmon I think is an Atari
product?

Any info appreciated!

Cheers

David

> disc format is the same as DOS's. Is this true?

Yes and no. The Macs Superdrive CAN read ST formatted disks.. sorta..
One of the problems seems to be software, not hardware. If you use the
generic Apple File Exchange, then all the ST disks MUST BE formatted
EXACTLY the same as MS-DOS disks.

One of these days I'll sit down and write a programme to read the more
unusual formats of ST disks (like 83track/11sec).. :-)

Hope that helps!

Source record: 190283

Ahh!, after running latest version of BACKWARD(v2.25) I dug out my
ancient PC-DITTO disk. It worked. Sort of. My DOS is old 2.11 I
think but will be trying out later DOSs. Procom has some problem
with screen colours, which I cannot resolve. Have not tried much
else yet.
Another problem is that it did not recognise IDE drive..

This is probably only of interest to industrial archeologists
but might have its uses..
Any suggestions about IDE welcome

Wrong, t = taint. This has nothing to do with tos<->mint. It is for
perl scripts that run suid root. Do to the lacking support in MiNT for
POSIX saved ids this will never work.

Message-ID: <1994Mar28.120303.8323@unix.brighton.ac.uk>
Source record: 190288

You could get Gnu's GCC up and running on your setup, but beware it is memory hungry and you may find comiling some large programs with optimisation on to be very difficult.

On the plus side, it very good, has (regular?) updates, and is used by alot of people. Mush of the pd s/w that comes out with source is written in GCC.

Michael

BTW it is a bit tricky to setup so it would seem. Personally I had little trouble, but alot of people do have problems.

You need WINXCOOK only if you patched your ROMs. WINXCOOK allows you
to configure your WINX even if WINX is burnt into your ROMs.

What happens if you put *only* WINX in your AUTO-folder? BTW: You are
not allowed to use ARROWFIX together with a newer WINX version.

Source record: 190293

Could someone put the MiNT 1.10 source archive on umich.edu (or tell me where it is if its there somewhere).
I know that MiNT binaries may not be distributed, but can patched binaries (eg the mint-net patched binary) be distributed? I'm not looking forward to haveing to recompile and apply patches etc.

Has someone out there done comparisons of the MiNT binaries compiled by different comilers for speed/size etc? Surely there's a binary which runs faster than others or one which is smaller etc. due to different compilation algorithms? Just tell me that Sozobon doesn't come out on top and I'll be happier!

: has a 720K floppy drive. Is there a program to allow me to backup
: files from my Atari onto PC formatted 720K disks which can be restored
: using the MSDOS RESTORE command. Or, can TAR do it as well. If TAR
: is the route to go, how do I do it and what versions do I need on both
: ends.

: Thanks,
: STeven Whatley

: P.S. Formatting the PC disks is no problem. It's just the transfering.

GNU Tar (1.11.2 i think is the latest version) will combine all files
to one and create multiple volumes if neccesary. You *cannot* extract
them with Tar, you need GNU Tar on the DOS machine.

There is a manual in texinfo-format, which comes with gtar.

gtar is able to call gzip to compress the output, this may help a lot.

I've heard word that there's another multi-tasking (pre-emptive) OS
which I think is similar to Mag!X for the ST.
Does anyone know anything about this ? It's cartridge based, made by
a company called Furst and it's called something like 2ST (well it has
a '2', 'S', and a 'T' in it's 4 letter name !)

Has anyone used this OS and is there much software available for it ?

Cheers,

Dylan

5753. Mega keyboard

Newsgroup: comp.sys.atari.st
Date: 1994-03-28 16:53:14 UTC
From: "Scott E. Parker WA7VYJ" <sparker@Coquina.cass.usu.edu>
Message-ID: <1994Mar28.105314.14462@cc.usu.edu>
Source record: 190209

'Scuze my ignorance but....

I am looking for a way to replace the keyboard on my 1040ST with
something better.
I saw the note in the FAQ about attaching a mega keyboard. Looks like a
simple enough
solution. The problem is, I have never seen nor handled a Mega keyboard.
My main
concern is havng a keyboard that feels and responds better than the sorry
thing that's
packaged into the ST. I realize that I am inquiring into a matter that
is to a good
degree a matter of personal taste and that what I really should do is
take a Mega keyboard
for a test drive, but I don't know of anyone who owns one around here and
there's no
Atari dealer that I know of for miles around either. So, I'm resorting
to USENET with
the following questions:

1. Is the Mega keyboard a "decent" keyboard (solid key contact, good
tactile feedback)?

2. What should I expect to pay for one?

3. Where's the best place to get one?

Your opinions, please....

Thanks in advance, -SEP

I read Ofir Gal's original intention about multilingual docs was that IF possible the docs should be in as many languages as possible in order to maximize sales, distribution, etc. As he stated, English would be a logical choice as one of the languages. The other choice of course would be the programmer's native language(German, whatever...). Of course not everyone knows 10 languages-but don't go slamming the messenger for stating the obvious: multilingual docs=wider program distribution. That's all Ofir was originally stating. Period. So don't go reading some kind of provincial chauvinism into it! **<sheesh>**

I would be leery of doing this, but if you try it and it doesn't get hot,
I cannot think of a reason why it would be bad. Note that cases designed
for convection air circulation are different than those designed with fans
in mind. I would monitor the heat very carefully.

I have bought high quality (quiet) wafer fans for about $12 each, compared
to $5 for crappy noisy ones. For $12, I personally would not risk it.

I have a Megafile 40 for sale...make me an offer.

(Yeah, Yeah, I know...there is no such thing as a megafile 40...
but if you replace the 20 mb Seagate ST-225N with a Seagate ST251-N
you get a 40 mb drive which works without a hitch...unless you try to
hook it up to a mega that already has an internal drive...which is why
I'm selling it!)

Are you sure it's the fan? This is easy to check. Open the case and prevent the fan from spinning while it's powered up. I had a noisy Megafile 60 and thought it was the fan as well. It turned out to be the drive that was noisy. I talked to a technician friend of mine and he suggested lubbing the spindle with petroleum jelly. This has greatly reduced the drive noise. I am actively looking for a replacement drive (anyone got an old seagate ST-277R?).

5764. Le Redacteur 4

Newsgroup: comp.sys.atari.st
Date: 1994-03-28 19:02:07 UTC
From: jhogan@uqac.uquebec.ca
Message-ID: <CnE27K.KGt@uqac.uquebec.ca>
Source record: 190220

Bonjour a tous,

Je cherche des personnes qui utilisent le logiciel Le Redacteur 4 ou 3
pour creer un petit reseau des usagers. Je pense que tout le monde
qui utilise Red 4 ou 3 a un probleme ou 2 auqeul qu'il voudrait decouvrir
un bon reponse. Ou, peut-etre que vous connaissiez des petits trucs
que vous pouvez partager avec nous-autres. SVP, si vous voudriez
partager avec nous-autres ou trouver des repones de vos questions,
ecrivez-moi.

jhogan@uqac.uquebec.ca

Merci,

Joseph

Okay, I wrote in french because I would guess that the majority of the
people who own Le Redacteur 3 or 4 know french. Anyway, if there ae any
users of this program out there who would like to share experiences, or
have problems that they woud like to ask other users, or if there are
any little 'tricks' that you know and would like to share or learn, please
write me at:

jhogan@uqac.uquebec.ca

Joseph

Vive le France
Vive le Quebec

Salut a tous

Hi Everyone,
I'm after the address of an ftp site that I can upload programs
to that I write. Can anyone out there suggest such a site - is there an
Atari ST/TT/Falcon specific archive site anywhere on the net?

Regards,

Stu...!

P.S. Please reply via email to scoates@filesys.demon.co.uk

I have an atari 1040st and I'd like to know where I can
get a new TOS by ftp to my computer. I don't a hard disk ,
I have a DS/DD disk drive. And I'd like to know about about
some small and good editor and some disk optimizer too.
Thank you very much if you can help me with them.
Marcos Vera Yanez.

> entirely? If there is no heat build up at all, is the fan necessary?

In the interests of HD life, yes, since the power supply does generate a fair
amount of heat, and so do the big 5.25" drives when heavily accessed.
You do have a fair margin to cut the fan speed however. Most of the noise comes
from the top 10-20% speed, so a 100-200 ohm resistor in series with the fan
+12V will do wonders. Many keep the speed, but cut away the grill in front of
it and enlarge the hole... this too makes an amazing difference.

> to read). It just came with a couple of photocopied sheets telling you
> to be careful if using a non-MultiScan. It didn't explain much about
> the bootconf program. Anyone know what the FFC button does?

Okay, I'll try to explain why this is no bug:

Assuming you have selected 800*600*16 on your monitor. By
default you use the switch for 80 columns (which is only true with
640*xxx pixels, because we are not DUMB-DOS using 80x25 on a 21"
monitor) and line doubling disabled.

Now you enable line doubling. You told BlowUP in the blowacc to use
800*600 if you use 16 colours. What do you expect BlowUP should do
now? Switching to interlaced? What should happen if this resolution is
already interlaced? Switching to 800*300? Where should BlowUP know
what settings to use in this mode?

The same questions if you switch to 40 columns mode. What do you
expect BlowUP should do?

So the BlowUP authors asked them what they should do with these
switches. They detected a new and unused Feature in the FALCON AES and
used it: Line doubling now makes real line doubling (characters have
half height now and horizontal sliders, too!) and switching to 40
columns gives you double columns (characters have half with then and
vertical sliders, too!).

See, this is no bug, is it? Screenblaster totally ignores both
switches. BlowUP was the first Hardware available and it had a
Realtime Video Mode Generator from the first day! Screenblaster call
their *new* product now Screenblaster II (wow!) and you still can't
adjust the resolution in realtime, you always have to switch between
a test picture and the VMG.

The FFC-button means "FlickerFree Compatibilty", which means you get
higher refresh rates even in the compatibility modes.

> The software on the accompanying disk was also labelled DEMO VERSION!
> (This was BlowUp Hard I).

Ups! I think it was a mistake. The software works for you, doesn't it?

> Are software updates available freely anywhere?

Sorry, don't know. Ask one of the authors, for example
acher@informatik.tu-muenchen.de.

5772. Atari PD/SW Education Software?

Newsgroup: comp.sys.atari.st
Date: 1994-03-28 22:39:17 UTC
From: rmgreen@edu.uwo.ca
Message-ID: <2n7mal$jos@falcon.ccs.uwo.ca>
Source record: 190229
Cross-posted to: comp.sys.atari.st,misc.education,sci.edu

Dear NetFolk;

I am wondering if there are any ftp sites which house public domain and/or shareware educational software for the Atari ST. Software covering the full K-12 (+OAC) range is being sought for a private project of mine, and material dealing with science would be of particular interest.

If anyone out there can help, please post or E-mail; I read all three groups this has been posted to, but E-mail is likely best as I suspect that there aren't all that many educators using ST systems themselves... (their loss). :')

Thanks very much in advance.

>

Oh, I agree whole heartedly. Even considering JUST MIPS, the 68000 has been rated with a 386sx (And the 386 instruction set still wasn't quite up to the complexity of the 68000's)

In fact, the ONLY reason modern Intel chips have been rated as only ONE generation behind Motorola in power (i.e., 486 vx 030, 586 vs 040) is because the Intel chips can run at 3 times the clock speed. On a per megahertz basis there is no comparison.

For example, the PPC 601 has been rated under varying conditions at roughly five times the speed of a comparable Pentium, and yet Apple has OPENLY admitted that the 68060 is faster that the PPC601. It's the next generation PPC (Unsure if they were talking about the PPC 604 or PPC 615) that is supposed to beat the 68060.

But, to be fair, remember that you aren't comparing processors aimed at the same league of users. When the 68000 was released in 1977, it was used in minicomputers and ushered in the first "workstation" computers. When IBM introduced the first PC in 1981, it was trying to compete with the 6502 and Z80 8-bit computer market. Meanwhile, 68000's were the heart of SUN and HP-Workstations, and it was considered beyond reason that any individual could own that kind of power. (Look around you... the majority of all the old workstations still in use are 68020 based, including new X-terms.)

Intel based computers had the capability to enter the "modern-style" personal computing market with the 386, and to some extent did, but IBM software needed time to catch up to the "new" style of computing. It wasn't until the 486 came along that Windows were fast enough to change the IBM market from 8-bit style DOS programs (e.g. Word Perfect 5) to the "modern" mid-80s style interactive graphics/WYSIWYG platform.

(BTW, don't you love all the marketing hype claiming that RISC is the "new" technology, and CISC is the "old" technology at the top of its performance curve? :-)

The name of the company is SIBNET not Sydnet, and I can confirm (at this particular moment in time) that they will not be doing warranty service work for Atari. So all those peoples with falcons <1yr old had better make sure that they don't blow up ! Otherwise they will have to get legal with the liquidator of ATari _NOT_ the retailer that they bought the falcon from.

I know that they won't be doing work because they situation with atari Australia is that they are officially in liquidation and any requests for payment to service people for warranty work will be delt with by the liquidator. So.. I doubt you will find any service companies willing to do warranty service work when Atari Aust has large debts to other people.

The problem with using a Spectrum-like system in medium res to get 16 colours is the same problem it has in low resolution to get 512: You don't _really_ get 512 colours. In fact, what you get is 46 colours per scan line, and each scan line can have its own set of 46 colours. That's when you've got a 16 colour palette to play with; the palette is switched at every scan line, giving you this effect.

Unfortunately with medium res you only have 4 colours to play with, so the possibilities are still extremely limited, and it's doubtful you could achieve a full 16 colours on one line of text.

> Is there a program that will play MOD, WAV, and other sound files on
> my Atari? I have copied some programs off of atari.archive.umich.edu,
> only to find that they seem to only be for STE's, or only run in color.

Try the Petra addendum program to the Paula STE MOD player. Petra will play MODs in monochrome mode, AFAIK, but only at up to 12KHz on an ST.

> (What the hell does color/monochrome have to do with sound reproduction???).

It's rather complicated, but I'll try and be as brief as possible:

First, you have to know that colour monitors either operate in 50Hz (PAL) or 60Hz (NTSC) mode. Monochrome monitors, on the other hand, operate at a refresh rate of 72Hz. The refresh rate is how often your screen is updated. Now, there is a certain interrupt (location of memory where small program routines can be stored and played automatically by the computer) register in the ST (and all computers) called a Vertical Blank Interrupt, or VBI. The speed at which this interrupt runs depends on the refresh rate of your monitor. If you are in PAL (50Hz) mode, this interrupt will run itself 50 times per second. In NTSC mode, it's 60 times each second. In monochrome, again, it's 72 times each second.
How this relates to MODs is that most MOD players use this VBI to store its playback routine, so that the program doesn't have to handle it in realtime; it just lets the computer take care of it all. Usually, the routine that is stored here is the routine to playback the actual musical score of the MOD file. Therefore, if it's played in PAL mode, it will update the musical score routine 50 times each second. In NTSC mdoe, however, it will update this routine 60 times each second, and therefore the musical score will sound faster.
Most MODs are written in PAL mode, or 50Hz. And since most MOD players requre that interrupt to play the musical scores, they should be played in PAL mode in order for the speed to be correct. Since your monochrome monitor operates at 72Hz, this is not a feasable idea.
However, players like Petra and Modplay (a small background MOD playing DA) are interrupt-independant, which means they do NOT use the VBI for the play routine, so the refresh rate of your monitor no longer matters; it will simulate a PAL mode (though Petra will allow you to set the simulated refresh rate as you please)

> I understand that MOD files are sampled sounds from Amiga land.

Actually, they're four-track digital musical scores.

> I understand that WAV files are sampled sounds from DOS/Windows land.
> I understand that DOS/Windows has midi data files as well (.MID?)

.MID files are MIDI type 0 files, and are not machine-specific. WAV Files are
WIndows sound files, and should be playable in any sample player.

5792. Re: Another multi-tasking OS for ST ?

Newsgroup: comp.sys.atari.st
Date: 1994-03-29 10:17:39 UTC
From: cwood@gst-soft.demon.co.uk
Message-ID: <1994Mar29.110102.1@gst-soft.demon.co.uk>
Source record: 190249

TITLE: Re: Another multi-tasking OS for ST ?

It's SMS2, and its very different. As stated its fully
non-compatible, and very difficult to use. We got a copy
becuase the copy licensed something from us I believe.

It is very fast but only supports hi-rez at the moment. The
ideas do not seem to conform to TOS or UNIX ideas they have
really stuck their neck out! Instead of a flat filesystem
like Unix or drive letters like T/DOS they use wierd names
like flp1_ and whd1_.

The GUI is somewhat difficult to get to grips with at first
and personally I feel it is too different from X/GEM or Windows
to make it good for beginners.

To make it truely appealing, I would suggest that the GUI be
changed more in line with other GUI's, have either UNIX or
TOS style filesystems, with support for Minix and TOS disks,
even if it's just for reading. Support for TT and Falcon 256
and above colour modes will also be essential. With this I
would consider it and excellent buy.

BTW It's 135 quid, I believe, and more intersting than OS/9.

5795. c++ to falcon???

Newsgroup: comp.sys.atari.st
Date: 1994-03-29 12:32:11 UTC
From: gaston@ludd.luth.se
Message-ID: <gaston.764944345@father.ludd.luth.se>
Source record: 190102

Hi.

I want to do some programming in c++ on my falcon
and I've heard that GNU:s was the only one available.
BUT , what do I exactly need, there are files everywhere
and I would like to start this decade.
So if there are someone out there, perhaps using it
yourself, who can explain to me what files I need
please e-mail me then: gaston@ludd.luth.se

Thanks, gaston

5796. Geneva and Everest 3.0E

Newsgroup: comp.sys.atari.st
Date: 1994-03-29 12:48:30 UTC
From: ant@mks.com
Message-ID: <1994Mar29.124830.25009@mks.com>
Source record: 190103

Everest 3.0E 29.8.93 appears to have screen redraw problems when used
with Geneva.

a) The interaction of Everest windows with other application windows
is poor.

Symptoms: It appears that when Everest is made active, it fails
to redraw its top window, assuming its the only one running.
None of the Geneva flags appear to solve the screen redraw problems.

b) The Replace dialog fails to display characters in the edit fields
that are typed in. This may be symptomatic of all dialogs in
Everest.

Suggested bugs fixes or known workarounds welcomed.

>|> a company called Furst and it's called something like 2ST (well it has
>|> a '2', 'S', and a 'T' in it's 4 letter name !)
>SMS2? Heard of it but that's about all.

SMS2......I recall seeing it at it's (Apparent) launch at the Northern Atari
Show in Manchester.

Must say that I was impressed by it....however, wasn't too keen on the fact
that TOS/MINIX software doesn't run on it. But then Again TOS cannot run MINIX
software and vice versa.....

Can't remember much, but I've got a fact sheet at home that I picked up at the
show, so if anyone would like an ASCII copy, then mail me.... ;-)

The OS is cartridge based, and runs on both the ST and Falcon....the ST demo
was being run on a mono monitor....so don't know if can use in low and med rez.
However, the Falcon version was in colour...I remeber being told thet the thing
was configurable, and that any configuration that you wrote could be saved on
to the Programmable Erasable Read Only Memory (PEROM), with the default config
only being a kestroke away. I also remember it being fast, and fairly cheap
(135 pounds....although I cannot afford it).

All in all, I quite liked it....

If I remember correctly (and if not, someone yell :-) that at the
moment, a first class letter sent from the U.S to the U.S. is
29 cents, sent to Canada is 40 cents, and sent to Europe is 50 cents.
At least this is what I recall when registering a couple programs...

I dunno how this reflects on packages, etc...

Hi all,
I have some questions about 3d party hardware for the Falcon:
-Can anybody confirm the devellopment of a 486 emulator for the Falcon?
-Does anyone know if this will support PC-CD-ROM via scsi?
-Anyone heard about a 8MB RAM-board for the Falcon?

First of all let's thank you for the incredible work you do for the Falcon owners. I saw ISHAR III in your list, do you have any confirmation from Silamrils that they are going to produce a special Falcon version as they did with I and II? I never saw one. Could you put a new but short list togehter of all games which have Falcon enhanced cap. or are falcon only? This would make locating these games easier, as I can't get myself to play these old ST games anymore. ;-)

Joost.

5808. Stereograms again

Newsgroup: comp.sys.atari.st
Date: 1994-03-29 14:08:10 UTC

I want to thank everyone - I've got gcc and g++ working at home. The only problems I have are that the g++ library is not automatically added at load time (I can handle that). I tried to build a module of the examples with gem++ and got some link errors for class methods that didn't have exact type matches (bool to Int) - I can also handle this.

Now, I need printable materials to get going (bash docs, gem++ docs, a man page reader). And, can anyone point me to the specific archives I need from a umich mirror to set up (yech) TeX at home on my ST?

Thanks again and have fun! - Bob

>
>Thanks in advance
>

ASCII files should be directly readable on the other computers.....all the computers should be able to read your disk, if it was formatted on an ST or IBM. However, if the MAC and AMIGA can't read the disk, I suggest copying files from your ST disk onto the IBM, and then formatting a disk with the IBM before copying the transferred contents onto this newly formatted disk. The AMIGA and MAC should be able to read the new disk.

Or am I missing something here???

Danny.

I have Transartica and Ishar 2 (Falcon versions) and both are worth getting IMHO.
A must though is the GEMd Nethack. Superb game, great fun and free!

Oh come on.....I am too interested in this topic, and don't understand any French at all..... Please repost the reply...this time in English.

OK, so you are French and can speak English......why shouldn't I know French...

Wel, I'd like to learn, and will in the near future. Languages I can speak fluently:

English
Hindi
Punjabi
Urdu

Languages I am learning:

Japanese
Mandarin

Languages I want to learn:

German
French
Spanish (Already know some)

So please take pity on me....and repost in English

You need: -first- gemram (v1.5 or 1.6) (or equivalent) -then- winx
(best v2.2) -or- arrowfix (check executing order at bootup). (winx
does a better arrowfix than arrowfix itself).

Craig,

The offline reader will be for a UUCP node. I would like to
know where one can get a hold of these pieces of software. If you
can post the address where they could be found, that would be great!!

Thanks,

Joseph

This is not as bad an idea as some may think. Everyone would benefit form improved file systems, and commercial developers get paid for their work, so indeed why not club together and fund some development. I am not suggesting we buy him a Falcon, but of course he should be free to do with the money he gets paid whatever he wants, and that includes buying a Falcon if he thinks he needs it. Unfortunately I do not have the time to host such an operation, but maybe someone else will.

I am looking for a shareware/freeware program that will take odd graphics files and print them. Alternately a program that will convert them into GEM files which I can print. Any help would be appreciated.
Thankyou

5819. **Atari ST Software for Sale**

Newsgroup: comp.sys.atari.st

Hi Everybody,

We have the following Atari ST software for sale. All prices include shipping within the U.S. and we're willing to consider any offer. Please email me at CROWDER@NETCOM.COM if interested.

Prof. Craps (Learn how to play craps)..... $13.00
Borrowed Time (Great adventure game)..... $13.00
Mindshadow (Great adventure game) $13.00
Bartender's Guide (Learn how to mix drinks) ... $13.00
Thunder (Spell Checker)..... $13.00
Math Talk (Kids math game)..... $13.00
Shareware Disk ..... $ 8.00

>then it will fall back to 2400 at MNP5 (if your modem supports that...)
>You're right. It's dated...

I tried last night, using a Supra 144LC. As you say, best I could get was 2400 by forcing the connection rate! The fallback dropped to 1200 when I first tried! Now, I would like to upgrade to the latest ICD driver for my AdScsi+, but there is not a cat-in-hell's chance that I'm going to download ~500K from Illinois to Seattle at 2400 baud. MNP-5 is near useless in this case since the file is already lha compressed. I did leave a message on the board to this effect...

Cheers, Steve

From the Holy Book of <1994Mar28.133516.17512@praxis.co.uk>
as spake by bjb@praxis.co.uk (Ben Bell) :

>Could someone put the MiNT 1.10 source archive on umich.edu (or tell me where
>it is if its there somewhere).

Actually, there has been a flurry of patches relative to 1.10 on the
MiNT mailing list, so even the "official" 1.10 sources might not be
sufficient. I think the current plan is to let the dust settle and then
release the result as 1.11.

> [...] Just tell me that Sozobon doesn't
>come out on top and I'll be happier!

Not only does it not come out on top, it's not even in the running; I
still haven't figured out how to get it to compile MiNT successfully.
Maybe over the summer...

Have you heard of a DEKA - it's short for Detatchable Extended Keyboard Adaptor With it you can attach any standard dos box keyboard. I have 2 of them & am using 1 of them top replace my Mege E keyboard which needed repair. It works great & dos box keyboards are cheap - especially used ones. Oh, there's also a German DEKA i believe & it's supposed to be even better because it will allow the hooking up of a dos box mouse as well. Ciao

It's Ensign Melba Jim - he's toast!

This sounds strange. I have never in one year had any such problems. Actually, I've found TOS 4 to be very stable and crash resistant. Are you sure it isn't some other resident program that cause this to happen? About the modem... You should as a general rule never switch on or off things connected to the computer while it's running as this could (however unlikely) cause permanent damages to the computer.

MiNT has been copyrighted and owned by Atari for quite some time now.
Versions of MiNT before Atari bought it (0.96, I think) are still
available in binary form. If you want a newer version you must
compile it yourself, or buy MultiTOS from Atari.

Recent versions are still made available by Atari in source code form
for free, in the hope that people will make contributions to its
development. Most of the source releases aren't "production"
versions, so if you can't compile them you shouldn't be running them
anyway.

Cheers,
entropy

p.s. I don't speak for Atari. I don't even *want* to speak for Atari

Huh? What's this about not distributing binaries? I've been waiting until
I had some time to go fetch the MiNT binaries and install them on my machine,
but I don't even have a C compiler! (and somehow I doubt that MiNT was written
in GFA BASIC)

Is this no-binary thing just because the version is new, or have I mis-
understood something, or what?

>and No ACC running, I don't know if this helps..
>
>I then run HOWFAST, but that gave me some 900k and
>about 200k Writes...

That's because RateHD measures raw transfer, and How-Fast writes and reads through GEMDOS, which consumes some extra time. Slow writes are normal for slow systems :-)

Brief description of the main screen (from main brain :-)

Three sliders, the upper two are smallest and largest file size to be used. Don't exceed your available RAM space, or you'll get error messages while testing.
The third slider is number of tests.

There's a button "Maximum" or "Y-Achse" or so, click it and choose from auto-detecting the maximum rate displayed or enter a static one.

On the right, select a drive to run the test on.

That's all, I think you guys already figured what "Exit" and "Run" are for :-)

bye, Peter

Oops, I forgot. Version 1.0 is the one available for the moment, the package is up to 1.04 by now, the latter was made for testing read-only devices like CD-ROMs.
Version 1.00 is OK except for:

- it always wants to write, which fails on CD-ROMs,
- it crashes on large partitions on the Falcon,
- the values on the X-axis are shifted to the right by 1 square.

Source record: 190139

>Can someone tell me the difference beetween ICD's "The LINK" and GE
>SOFT's "TOPLINK" ?

It's in the hardware:

First, ICD's adaptor really is an adaptor with a separate cable attached to it. GE's looks like a plain cable.

Then, the GE adaptor handles parity and thus is far more compatible to newer drives.

Furthermore, ICD's software is far better, the GE TOLPLINKs just comes with formatting tool, driver and floppy backup program.

Last, the GE adaptor doesn't contain terminators, so you'll have to terminate differently to the ICD adaptor, which does have terminators.

> If I buy a TOPLINK adapter, can I use ICD Pro utilities ?

Yes. ICD Pro utilities don't care about what hardware you use. The GE TOPLINK comes with (rater poor) software, I used ICD, SCSI-Tool and Atari software with it successfully.

bye, Peter

> Does anybody knows can I to fix this 1.44 Mb drive for use like a
>Double Sided drive ?

Well, here's the frequently made mistakes.

First, Note that the colored ribbon on the cable (red or blue) is pin #1.
Connect this to pin #1 on your drive. Most HD drives need you to turn the cable
over after removing an old DD drive.

Second, the new drive needs to be jumpered DS0 (or D0 or A or something) to
become drive A:. Most drives are sold DOS-box ready, and are jumpered to be DS1
or D1 or B.

>understood something, or what?

Since after 0.96, Atari/Eric Smith has only allowed source distribution of
MiNT, since Atari is using it as the kernel of MultiTOS (a commercial package)
and only wants somewhat qualified people using MiNT so they don't have to deal
with J. Random calling and asking questions about how to use a free package.
(I am actually just presuming this is the basic reason.)

Later,
Steven

Yeah, that's fair enough, I agree with you entirely etc. [g] I think the problem with this whole non-argument is that some people took some statements the wrong way and it blew up. [if i wanted to be a bastard I'd idly ask at this point wether infamiliarity with english might have caused it [vbg]]

I know.. let's just say "wouldn't it be nice if all docs/programs were in english, german and any other languages which the majority of Atari people use" and leave it there?

SS>

End of SBAILE31@MAINE.MAINE.EDU's quote...

Same here.. I use a Mega4 STE and a Mac LCII and don't have *any*
problems.. Cept for it's only good for transferring text files and not
archives.. I know have the two machines connected via null-modem and it
works great! In the background with stalker even!!

>and becomes very usable.

Does anyone know how AES4.1 will become available? Will you have to
upgrade to version XXX of MTOS to get it? Will current MTOS users have an
AES-only upgrade (I already have MINT1.08) ?

BTW, what is the compatibility and/or advantages of MTOS (or perhaps
just MINT) vs Powerdos? Will someone rewrite such things as floppy formatters
and modal alerts (I think that is the right term) that still inturrupt my
downloads no matter what priority my download program has? Its annoying that
I lose packets when I go to use the built-in fileselector while within a
different program.

You could just use a common compression program (ZIP,LZH,ARC,ZOO), or
you could get a lead and connect the serial ports together and do
a zmodem transfer... should take less time than it would
take to compress-save-load-decompress using floppy.

>with J. Random calling and asking questions about how to use a free package.
>(I am actually just presuming this is the basic reason.)

Yuck. Has anyone here, ever, gotten any useful response from Atari about
anything? When I got my MegaSTe, it had a bad host adapter, which basically
produced strange problems I didn't understand. I searched high and low for
a user help number or address, but couldn't find anything but some computer-
operated help line concerned mostly with video games, which had no operator
available. Unless they've performed a radical about-face in the past couple
years, I don't think Atari are being swamped by J. Random calling and asking
questions about anything.

Argh. That company frustrates me so.

I'm *fairly* sure this is the alternative Sinclair QL operating system
which was developed along with QDOS. AFAICR SMS2 gets mentioned in 'QL World'
magazine - and this SMS2 cartridge is really designed to allow QL software
to run on a faster machine than the QL itself.

At least I *think* thats what its all about. I don't have any information
to hand at the mo.

>I know that MiNT binaries may not be distributed, but can patched
>binaries (eg the mint-net patched binary)

AFAICS having read the MiNT and MiNT-Net docs - you are out of luck. The only way to get a MiNT-Net patched 1.10 MiNT appears to be to compile your own.

A patch for the binary itself might be possible, but there are dozens of different binaries possible depending on the version of compiler and libraries used to build it.

Compiling MiNT is something which I'd rather not do either, but there doesn't seem to be a choice.

>Has someone out there done comparisons of the MiNT binaries compiled
>by different comilers for speed/size etc? Surely there's a binary

I've been compiling MiNT with GCC 2.3.3 with PL3X libraries. I don't think this gives a particularly small binary, but it seems to work very well.

:-)

Newsgroup: comp.sys.atari.st
Date: 1994-03-30 04:46:47 UTC
From: warwick@cs.uq.oz.au
Message-ID: <2nb07n$fma@uqcspe.cs.uq.oz.au>
Source record: 190171

swhatley@blkbox.COM (Steven Whatley) writes:

>Can I put the G++ library and include files in the same dirctory
>with the Gcc files? Or, do I need a separate directory for them.

No - they clash (eg. stdio.h is in both).

For example, you can do this:

.../gcc/include/<put all the gcc includes here>
.../g++/include/<put all the g++ includes here>

GXXINC=.../g++/include
GNUINC=.../gcc/include

G++ checks for included files in directories in $GXXINC then in directories in
$GNUINC.

GCC just checks for included files in directories in $GNUINC.

Aside (to all):

Did you know that you can link GNU C and GNU C++ object files
together? For example, GEM Nethack is the standard C code for
Nethack, linked with C++ code for the user interface (and GEM++).

Also, many C programs compile directly as C++ code.

5867. Wall Street Journal writes about Atari

Newsgroup: comp.sys.atari.st
Date: 1994-03-30 06:39:22 UTC
From: molin@cxc1.cl.msu.edu
Message-ID: <2nb6qq$8cd@cxc1.cl.msu.edu>
Source record: 190174

There was an article in the Wall Street Journal, I believe it was the
March 28 or 29 issue, concerning Atari's continued lossses and current
stock prices. I won't type the whole thing in, but will summarize some
of its contents:

==========
ATARI LOSS WIDENED DURING 4TH PERIOD AS SALES FELL 67%

Atari Corp reported 4th-quarter loss on 67% drop in sales, and warned
it won't be profitable un Jaguar is shipping in greater quantities.
None-the-less, stock rose 87.5% to $7.375 in ASE trading based on news of
Time Warner's infusion of $12.8 million. TW now owns 27% of ATC, up from
25%.

[Here's the not-so-unexpected bad news...]

Analysts say the above results are in line with expectations, now that Atari
has switched from selling computers in Europe to selling video games in
the U.S. In a statement from Atari, ATC has "substantially completed" its
transition to selling video games, and that its future hinges on the success
of Jaguar.

Atari claims Nintendo settled a lawsuit about horizontal scrolling patents,
terms undisclosed. Atari says Nintendo paid cash to settle and to license
patents, Nintendo said that it _received_ payments and patent licenses from
Atari on a royalty-free basis. Atari says "Nintendo is full of it."
Atari has a similar suit pending against Sega.

==========

So now when Bob Brodie hems and haws during his monthly roundtable
conferences on GEnie, we can all ask him about this. While he purports
to not seeing the handwriting on the wall, the rest of the sentient
and perceptive Atarians won't be so blind.

"Atari. We're not just playing games anymore."
"Atari. Power without the price."
"Atari. Real computers for real people."

5869. Wall Street Journal writes about Commodore

Newsgroup: comp.sys.atari.st
Date: 1994-03-30 06:49:14 UTC
From: molin@cxc1.cl.msu.edu
Message-ID: <2nb7da$8du@cxc1.cl.msu.edu>
Source record: 190176

The Wall Street Journal printed an article about Commodore International,
I believe this was in March 28 or 29 issue. It's too long to quote, so
I'll just summarize:

==============================
COMMODORE SAYS IT FACES POSSIBILITY OF LIQUIDATION

C= warned that it is on the verge of collapse and could be liquidated unless
it secures new funding. Maker of Amiga said it is attempting to negotiate
restructuring plan with creditors and suppliers that are suing the company.
(Nature of lawsuits was not divulged.) In earnings reports, C= says
"In the absence of additional resources and a restructuring, the company may
become suject to reorganization or other liquidation proceedings."

For second quarter ending Dec 31, C= had loss of $8.2 million ($.25/share)
compared with loss of $77.2 million ($2.33/share) a year ago. Revenue
fell to $70.1 milion from $237.7 million. C= stock fell 12.5 cents to
$3 in NYSE trading.

==

Maybe the people at Commodore learned their marketing skills from Jack?
Seems everything the Tramiels touch turns to shit, doesn't it?

You'll find v2.52 of BACKWARD on atari.archive (this presuming that the
above is not a typo of transposition...)

Hmmm, after thinking very little of this game when I first looked at it, I decided to have another go after reading all the rave reviews etc. (Such as in AEO 03-05). This was a very bad idea, as I am now quite hooked on the game. Bad graphics and pretty terrible sound, but very fast game-play which is what is needed! I can't wait until I (Maybe), get a Jag' as it looks like this may be one of the must-gets (Along with AvP and Kasumi Ninja!)

Does anyone out there in Australia know if there is anywhere in Perth that sells Jaguars+cartridges as nowhere in this country does, and I'm likely to be near Perth-central (Around the area of the 'Power Museum') and it'll probably be my only real hope of getting a proper Jaguar, hopefully with the S-Video Convertor! (This is during a trip out-of-country in the near(?) future! :)

Not a little bit, a whole 64! ;-)

5874. Re: SCSI controlers

Newsgroup: comp.sys.atari.st

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,fr.comp.sys.atari

PLEASE STOP THIS FLAME-WAR !!!!
SVP, ARRETEZ CETTE POLEMIQUE !!!!

I am French and lazy, this is why I posted the question about SCSI
controllers in English (on 3 newsgroups, 2 are in English) and posted
it too on fr.comp.sys.atari without any translation. I didn't think
this could start a flame-war. (now the same in French!)

Je suis Francais et faineant, voila pourquoi j'ai poste cette question
sur les controleurs SCSI en Anglais (sur 3 groupes ATARI, 2 sont en Anglais)
et aussi sur fr.comp.sys.atari sans l'avoir traduite. Je ne pensais pas
que cela declencherai une polemique. Milles excuses.

NOW PLEASE, ANSWER MY QUESTION AND STOP THIS FLAME-WAR. THANK YOU
MAINTENANT SVP, REPONDEZ-MOI ET ARRETEZ CETTE POLEMIQUE. MERCI

1 Technical Info

My email address will change more than once next time. Due to this reason I have an alias, forwarding my mail to my actual location - and if it's in the MAUS Net: G.Castan@physik.uni-stuttgart.de

For easy location of this document at servers and mailboxes, I ask for
using the following name(s) and saving the ascii AND TeX versions:
FILENAME=
gdosi19e (english version)
gdosinf19e (when using UNIX) CR+LF should be used when saving at
UNIX-Fileservers too, not just LF

2 Introduction

Actually I'm writing a program, that makes his print out via GDOS. Looking
for printer drivers I faced the problem, that many times no documentation is
included to the drivers.

Otherwise it may happen that there are different drivers with the same name.

Here I have briefly collected my experiences with printer drivers.

This collection doesn't generally want to describe coders how to use
printer drivers (except to problems not mentioned in literature). And you
wont find information about the concept or how to install printer drivers.
To get this refer to the list at the end of this FAQ.

What I want to exclaim here is more information about the several drivers:

- Where are the drivers available?
- How to distinguish them?
- What are the problem with them?
- Which drivers can be used for certain printers?

If anybody has more experience or questions, please write me. I will face
the work to update this FAQ.

Gerd Castan.

3 Motivation

With GDOS it took me 2 hours of coding, to get the screen-output to the
printer in maximum quality. And (almost) with no extra work I get output to
printers I even don't know.

If there's anybody who wants to write a program with printing options, he should better care of the main job of the programm.

Nobody wants to pay for printer drivers if there's another program that didn't take the coder extra work with such stuff making this program less expensive (and surely better).

The User has - besides the lower price - another advantage. If he uses several programs he needs place for the driver and the fonts only one time on the disc.

SpeedoGDOS is available from Atari shops (Atari Competence Center in Germany) now.

The (qualified) feedback to my FAQ has - compared to last autumn - raised remarkable. Due to Speedo the interest in GDOS coming from the coders seems to be bigger.

4 Changes

New chapters/infos are marked with '+', changed ones with '*'. Smaller changes aren't marked.

PAINTJET	14.08.92	60173	I				SP, OTL
_PAINTJET__	13.10.91_	_45934_	_WT_____	___	___	_____	SP_____

Note: The drivers named HP_LJET and DESKJET can be used for (HP-compatible) ink and laser printers. The difference is in the transfer to the printer: Packed (p.) or not packed (n.p.). 'Delta' means that the data is delta packed.

PAINTJET is a color driver with 8 colors.

MT90 is made by Patrick Dubbrow.

Using ink drivers produces a problem with bitmap fonts. Using 300dpi all is ok. But 360dpi fonts are optimised for best efforts with pin printers having thick pins. Using ink printers makes the fonts look much too thin.

Solution: either use 300 [600, 1200 :-)] or exclusively use vectorfonts

SLM	02.07.93	63987	Speedo 4.2		n		LS, SPD
_SLM_HS____	_____	_____	ROM_____	___	_n_	_____	LS,_SPD___

SLM_HS is a SLM driver for Falcon.

5.6 Screen drivers

The screen is (if VDI functions are used) seen as an output device just like printer, plotter etc. That's why fonts for the screen can be installed in ASSIGN.SYS just like for printers.

Normally this isn't remarked because the drivers are in ROM. But they can be used like printer drivers.

Note: For Systemfonts only (like the original ones) non proportional fonts with a 8*8 or 8*16 matrix can be used. That's limited by the AES not VDI.

With newer AES (from 4.0?) it's no problem to use fonts of free choice (Variable AE_FONTID and AE_FONTSIZE in GEM.CNF, see [15]). Coders should make sure their programs can take that. (even like scrollbars of free width)

Bitmap fonts not assigned for screen driver 1 are not available for other screen drivers.

5.6.1 LineA

The so called LineA-routines are subprograms of the screen drivers from the ST series, to be treated as undocumented. This is the hardware depending part of the drivers.

The attentive readers discovers it: Exchanging the drivers removes the LinaA-routines too. As happened with the TT for example.

So never use them!

Reading access can be taken to the LineA variables. But Why?

5.6.2 Setscreen & Getscreen

These XBIOS-Functions (mostly Setscreen) shouldn't be used.

But what am I talking. For those using them or those being tortured because someone else did:

The Videohardware of 1040STE and Mega STE has a hardware bug. When defining a new physbase with Setscreen (and if it's the same gotten with Getscreen), it may happen that the screen is 'folded'. This happens due to the movement of a register at a special moment, which is only allowed to be moved at special phases of the screen output.

What has to be done?

Users: The programs NVDI and FALT_OFF stop this error. Or give this FAQ to coder.

Coders: Either even don't use Setscreen.
If you use it though: If physbase isn't changed, the value taken with Getscreen may not be used. Use the value -1 than physbase!

5.6.3 NVDI and WARP 9

There are two often used programs exchanging the ROM drivers: NVDI and WARP 9 (earlier QuickST). TurboST was distributed by BELA but isn't updated no more.

If these are used once, one will never want to miss them: the Desktop seems to be terribly slow. I will never want to work without NVDI on my Atari. Others say the same about WARP 9.

NVDI uses strongly optimised drivers for the ST and TT resolutions. Sadly I don't know which drivers are used by WARP 9.

NVDI is available from Behne & Behne and contains not only the drivers but a GDOS and a manual describing exactly all VDI calls.

WARP 9 is available from CodeHead.

Due to this NVDI is spread in Germany and WARP 9 in the US

Different to NVDI WARP 9 only speeds up the text output. Grafics stay slow as before. AND the newest version does'nt work with MultiTOS.

5.7 Other drivers

```

ING-0300 can be copied (non commercial). The other IMG-0??? drivers are by SciLab. ZEBRA is for the Zebra Labelprinter.

5.7.1 Memory drivers

A memory driver doesn't do anything else than a screen driver (see [14] and [12]). The output simply goes to another area of memory.

The normal v_openwk binding doesn't have all parameters needed to open this driver. If not included to the language this binding must be made by yourself. A listing is found at [14].

The memory driver listed above can produce b/w output only and has a logical resolution of 300dpi. The (Matrix) drivers tested by me have no problems with fonts installed that are for other other drivers. The memory driver should take screen-fonts - due to the 300dpi.

Problem could appear because of the aspect ratio (relation of pixelwidth to height) - normally not similar to the screen resolution.
Due to this circles can be displayed as ellipses.

With NVDI version 2.5 the output can be redirected to offscreen bitmaps. You can make any GDOS outputs to this bitmaps and copy the result in windows on the screen.

5.7.2 Plotter drivers

A HPGL driver seems to be distributed with the program DATA. On PD-Disk ST 458 (German PD series) is one too. If I get more about it I'll include this info here.

5.8 What's missing

I don't know drivers using the abilities of the following printers:

o Epson 360dpi Needleprinters
o DeskJet 500C
o DeskJet 550C
o LaserJet IV

6 Errors

Errors in the printer drivers - that I know - are the following:

1 These drivers display fonts with the attribute 'light'
2 Doesn't work on TT
3 The EXTENDED ENQUIRE FUNCTION (VDI 102, vq_extnd) doesn't give back the parameters as listed in the german 'Profibuch' (Jankowski, Rabich, Reschke - Sybex)
4 Using the attributes 'italic' and 'outlined' the letters of bitmap fonts are cut off on the right side. This error appears independent from other attributes being used.
This error was in the Libraries of the driver sources from Atari and seems to be included in all drivers except to NVDI and SpeedoGDOS.

If theres nothing written about an error I don't know if this error appears or not.

Seems it's no accident, that Xact only uses the attributes 'fat', 'italic' and 'underlined'. (See [14])

Another reason against using 'outlined' is the following:
If you make a driver calculate an outlined font from a normal one it get's 'wider' by two pixels. Due to the reason that a pixel has a width depending to the resolution (other than a fitted font) a text gets different widthes in each resolution. But who wants to have different textformat on different printers? The only way to stop this is letterspacing - typographic 'bullshit'.

7 Fonts

7.1 General

There are many fonts on the Internet only for the screen and maybe useable for one printer. Everybody using these fonts should know that he can't print documents in an acceptable quality via GDOS.

But in the Atari and former BELA package there are contained the fonts for all printer drivers in this package (the 360*360dpi fonts are missing in the Atari package). If you have a useable program you can print every document with every driver.

Speedo removes this problem.

7.2 Bitmap-fonts

The fonts used are Bitmap fonts in the DR standard format. (See [1] and appendix)

GDOS bitmap fonts have their width information defined in both, screen font and printerfonts. Sadly the designers were a bit too zealous and fitted the width

of
the sreen fonts to make them look very beautiful. That are they, but they're
not
similar to the printer donts and don't allow WYSIWYG.
No problem with Speedo fonts

7.3 Vector fonts

The vector fonts with the old FSM-GDOS format are named with OTL.

These fonts and drivers should'nt be used no more and are listed to only for
completion of this FAQ.

The vector fonts in SpeedoGDOS format are named with SPD.

8 Printer

Producer	Printer	Drivers Fitting
NEC	P6+,P7+, NECP...	
	P60,P70	NB15_(FX:_:,:NX1000)_
HP	LaserJet_II	HP_LJET
HP	DeskJet,_LaserJet_III,IV	DESKJET_(HP_LJET)
CANON	BJ10E	BJ10
CANON	LBP_4/8	CANONLBP,_LBP
Mannesmann-Tally	MT_90	MT90

Drivers in brackets work but don't use the ability of the printer totally.
This means - for 24pin printers - that these are used in 9pin mode. At
HP compatible laser and ink printers this means that the data isn't packed
though being supported by the printers.

Some Deskjet drivers are told to make problems. In this case try the Laser-
jet driver. The printing takes longer than (due to more data) but the
problems should be removed then.

The meaning of compatible normally is made by the producers of the
compatible printers.

Notes:

o If you don't find your printer in the list and knows a fitting driver,
please inform me.
o Try other drivers even if you have found one fitting to your printer.
o Of course the FontGDOS drivers have strong problems with the memory. But
the speed of them is faster than the other (Speedo not considered).

8.1 List of availability

In the German TOS-Magazin July '92 page 24 contains a list.
If you know about list available europe/worldwide inform me.

9 Programs

Nowadays it's obvious (but not usual) to use GDOS in every program.

The following list is limited to those using GDOS to print too.

Kind of Program	Program	Distributor	Speedo
Chart/Measureanalysis	Xact	SciLab	yes
	Off-Axis	ByTech	yes
	MM-Graph	Overscan	
	DATA_Professional 4	Ralf Wirtz	
	rho-Analyse	rhotron_GmbH	yes
Graphics	Xact Draw	SciLab	yes
	Kandinsky	U. Rossgoderer (Shareware)	yes
	Chagall	Trade-iT	yes*
	Easydraw	MIGRAPH	
	TouchUp	MIGRAPH	
	CHARLY_IMAGE	Wilhelm_Mikroel.	yes*
Spreadsheet	LDW Power Calc 2	MSPI	
	K_Spread_4	Omikron	
	Graal Calc 3	Editions Profil	
	Atari Works	Atari Corp.	yes
	OPUS	Doug Harrison (PD)	no
	BASiChart	Dr.__Ackermann	
Text/DTP	Calligrapher	Working Title	
	Wordflair II	H3	
	Timeworks Publisher	GST/H3	
	G&D Text II	Hard & Soft	
	Cypress		
	Papyrus (Gold) S	R.O.M.	yes
	Infinity	ByTech GbR	
	Atari Works	Atari Corp.	yes
	1st_Word_Plus_4.1	GST/ICP/COMPO	yes
Fax	Junior Office	TKR	yes
	Tele Office	TKR	yes
	CoMa	SoftBaerGbr	yes
Simulalion_of_dyn._Syst._	Dynasys	Digital_Systems_&_Consulting	
Text/List_printing	ProList	Richstein_&_Dick	yes
Chem.__Displaying	Monoklin	MAXON_Sonderdisk	
Circuitlayout	Route iT! & Circu iT!	Think!	
	Platon	VHS	yes*
Vektoriser	Convector_II	TEAM-Computer	

_Hardcopy_____	rhocopy_____	rhotron_____	_____
_Disk-List-printers_____	TreeView_2.4_____	Stephan_Gerle_____	_____
_Fraktals_____	Fractals_IV_____	Harald+Martin_Hansen_____	_____
_PS-Interpreter_____	Postman_____	SILICON_Technology_&_Promotion__	_____
_Concordance_____	Concordance_____	SPIRIT_WARE_____	_____
_Packershell_f.__MTOS_____	MARC_4.0_____	Think!_____	yes_____
_Logikanalyser_____	CLA_v2r1_____	C._Graham_(Shareware)_____	yes_____
_Adress base_____	Pegasus_____	PergamonSoftware_____	yes_____
_Symbolic mathematics_____	Riemann II_____	RichterDistributor_____	_____
_Database_____	Atari Works_____	AtariCorp._____	yes_____

This list is no commercial. I'll include every program I get to know.
(Comment by the Translator: Sorry for mentioning Atari Works three times,
but I wanted to keep the 'Text/DTP' and 'Spreadsheet' Chapters')

Notes:

o Programs listed in the Speedo column with yes* support Speedo but don't
use it - don't output text too.
o Xact can print without Speedo too.
o FSM-GDOS is included in the Wordflair II-package.
o Platon only outputs Metafiles via GDOS.
o I didn't make it to print via GDOS in OPUS.
o Programs only printing via Device 21 are out!

Kandinsky Version 1.57 and TreeView are available together in:
ftp.e-technik.tu-muenchen.de pub/comp/platforms/atari/incoming

10 Utiliies

10.1 fontfix

Problem: The font height is included incorrectly in some fonts. fontfix
discovers this error and corrects it.

On the Internet fontfix can be found here:

ftp.uni-muenster.de /pub/atari/Applications/Dtp/Fonts/Gdos

ftp.cs.tu-berlin.de /pub/atari/utils

10.2 Outline Fonts

Outline Fonts Accessory by CJG Copyright (c) 1992-1993 Atari Corporation

This utility edits the EXTEND.SYS for SpeedoGDOS. This file contains a description of the volume from the Speedo-Caches, the fonts and the font sizes. The Caches can be saved to disc an be loaded again, too. A well done program, except that the offered cache sized are fitted to FSF-GDOS, not Speedo

Filename: OUTLINE.PRG alias OUTLINE.ACC, 67644 Bytes

Included with SpeedoGDOS.

Why doesn't Atari make programs that include a display of the version?

10.3 Printer driver

GDOS Devices Accessory by CJGCopyright (c) 1992 - 1993 Atari Corporation

To edit the ASSIGN.SYS

Filename: DRIVERS.PRG alias DRIVERS.ACC, 64878 Bytes

Before starting this program it's better to create a backup of the ASSIGN.SYS!
The two reasons are the following:

1. The informations about the Bitmapfonts are removed without comment.
2. ASSIGN.SYS is replaced by a new one if 'Benutzereigen'-'Hinzuf gen' (in the German release) is selected wihtout any chance to get it back.
(The English Version should have a Dialog like 'Own drivers' 'Add' or similar). To all coders: Don't copy that style!

If this utility should sometimes display no drivers, simply start ASSIGN.PRG (see 10.4 ASSIGN)

DRIVERS.PRG/ACC only displays the speedo drivers of my collection. Does anybody know, how it does this? It doesn't even display the filename but a name being included as string in the driver. How does one get it?

10.4 ASSIGN

ASSIGN 1.0a is by Dirk Sabiwalsky (PD).

It tests three things:

o Are there several fonts using the same ID and have different Names (typefaces)?
o Are there several fonts using the same ID and the same pixel height?
o Are there several fonts with the same name (typeface) and different IDs?

10.5 FONTCHK

FONTCHK tests GDOS fonts if they have possible errors.

It's included with ProList, for example.

10.6 FONTCNV

Converts GDOS-fonts from Motorola to Intel format.

Comes with ProList too.

10.7 GEMFont

Font editor able to read Signum and PK (TeX) Fonts too.

Internet: ftp.tu-clausthal.de:pub/atari/systools/gdos/gemfo120.lzh
Use the chance to get a new unlzh or lhxarc.

10.8 FontMonger

Converter and editor for different vector formats including Speedo. Only works on IBMs or MAC though.

10.9 Font-ID

Font-ID is a little Freeware tool made by Frank Schneider. In a window it displays the fonts installed with GDOS or SpeedoGDOS including the Font-ID in different sizes. So you can get an overview when you don't have a program with font selector/ID display function at the moment.
11 Distribution

11.1 Atari

The drivers with the name Atari are available from Atari. Send three disks, Money for shipping and a friendly letter to them and you'll get them with printer drivers and fonts.

This Package is available at Atari-shops too.

No docs but for this price ...
(That's the way in Germany - other countrys may differ!)

11.2 BELA

The fonts with the name BELA were available from BELA

There were two discs with packed Printer-drivers and fonts for them

The fonts DO have the same IDs as ones from Atari, but the internal font NAME is different. Due to this these fonts are not correctly accepted by some programs if used with Atari fonts.

There's almost no documentation. Not even a hint about who owns the copyright for the drivers or about the author(s)

One last thing about BELA: R.I.P. ;-)

11.3 FontGDOS

The drivers from this package are really much faster than the former ones. (Only bitmap fonts and graphics are comparable of course)

I didn't have any problem using these with other GDOS ersions but you must limit use to the old Fonts.

FontGDOS is the successor to Atari GDOS. Mainly, it differs in the Bezier functions, and had faster (and colorable) drivers. It has no relation to FSMGDOS or SpeedoGDOS.

FontGDOS is available from several firms which use it for their programs.

11.4 Language

The driver named Language is spread on the language disc for the MegSTe

11.5 Internet

The drivers signed with "I" can be found on the Internet.
For example: ftp.cs.tu-berlin.de

11.6 Working Title

The WT drivers are spread with Calligrapher. They are (c) Working Title, the wt-driver are licensed by Working Title.

No drivers are on the Calligrapher DEMO-disc. The drivers coming with Calligrapher-lite (15DM) are signed with CL in the tables.

Screenfonts are on both discs.

11.7 Speedo-drivers

SpeedoGDOS is available for everyone now (in Germany 99.-DM)

Contents:

o Installation program
o Speedo font engine
o 2 programs to edit ASSIGN.SYS and EXTEND.SYS
o 14 Fonts in Speedo format by Bitstream
The Falcon Speedo (in Germany) comes with 18 Fonts now
o 14 Printer drivers
o An installation manual

Outrageous features are:

o Speed
o Not the whole font file has to be read (memory saving)
o 16bit-Fonts (no 256 character limit)

See [4]

The information if it's a Speedo or bitmap font can be found in byte 33 of the Fontname (vqt_name, INQUIRE FACE NAME AND INDEX, VDI 130). Zero means bitmap font and one means FSM or Speedo font.

Some Problems are inportant to be mentioned:

A coder can't find out if a driver can handle Speedo fonts (see last question in 10.3)

Some font IDs are used by bitmap AND Speedo fonts, though different fonts with similar IDs may never be installed the same time.

If you don't take care of this you'll get bombs.

Speedo depends on the user to install the right drivers and fonts. The coder cannot do anything to stop errors.

The best way is only to install bitmap fonts with the right drivers or to use a Speedo only system.

The monospace font coming with Speedo has no 'umlaute'

Don't Trust [14] about saying that SpeedoGDOS is not updated.

For Installation and coding best is to refer to [5-7]
Remember to start NVDI before SpeedoGDOS in the AUTO-Folder!

The ones that bought Speedo got 4.0, the Falcon-buyers got 4.1

Now Version 4.2 (beta) is available with remarkable bugfixes. Speedo 4.2 is (in Germany) available as bundle or update (40.-DM) from R.O.M.
Only COMPO is selling it single.

Speedo 4.2 get's the font ID by adding 5000 to the internal one. NOW the problems with same IDs in bitmap and vector fonts are history.

11.8 Speedo 4.2

SpeedoGDOS Release Notes
Version 4.2 Beta

The following is a list of changes made to SpeedoGDOS.

1) Line-A - Due to many requests from developers, SpeedoGDOS is now no longer Line-A dependent. All output is done through VDI calls. This was done to make Speedo compatible with various graphics cards, and to make it more multi-tas-king-friendly. In addition, users should be able to use various VDI replace-ments with GDOS.

Another benefit from removing the Line-A dependency is that we no longer have to worry about the scratch buffer used for algorithmic special effects. We have implemented the special effects inside of SpeedoGDOS and the drivers, so that the user/program does not have to worry about the memory needed to accomodate arbitrary sized characters. Unfortunately, this means that old drivers need to be relinked with the new independent library (found in the new driver kit).

There are plusses and minuses of the new implementation of special effects. In many cases, the special effects will be slower. With all previous incarnations of GDOS, you could not use 'bolding' or 'skewing' at non-90 degree rotations; now both of these work at all rotations. On the other hand, 'lightening' used to work at all angles and combinations of effects; now 'bold' mixed with 'ligh-ten' only work at 90 degree rotation angles.

Miscellaneous Note - When using special effects, many applications have a hard time placing the cursor. In both the v_gtext() call and the v_ftext() call, the

only cursor compensation to be made is for bolding. Bolding adds the thicken value to the number of pixels of each character. For rotated characters, note that the extra pixels can be considered a vector along the positive x-axis which is rotated at the same angle as the text and added to the advance vector; therefore, the length of the text string should remain the same at any angle. This is true even when SpeedoGDOS generates characters on a scan-line basis (when the character does not fit in the character cache), although it does not implement the special effects. Also, applications should watch for the case when they keep track of the cursor position with vqt_advance() or vqt_width(), instead of vqt_extent() or vqt_f_extent(). In versions prior to 4.2, the application could accurately place the cursor by adding two pixels for every outline character and by adding left and right skew offsets for a skewed string. Now these effects are generated by the outline font engine, so the application must either rely on the extent calls or it must inquire for the advance vectors for characters that are skewed and/or outlined separately. For compatibility purposes, it is recommended that the version number of SpeedoGDOS is checked so that programs can handle both old and new characteristics.

2) Font ID's - Speedo font id's have been promoted to a higher range of ID numbers. This was introduced to avoid conflicts with bitmap fonts and more importantly, with the system font (which conflicted with a variation of Swiss 721). For those applications which use the usual interface with Speedo (i.e. use vqt_name() to find out what the font ID's are), there should be no problem, except if documents have font ID's embedded into formatting information. Of course, all the user has to do is substitute the font. If the application actually goes into the font file header to read the ID, note that we are adding 5000(decimal) to all Speedo font ID's.

3) Printer Driver Incompatibilities - Speedo will now check the printer driver it is trying to load for the '_FSM_HDR' cookie embedded in the driver header information. If GDOS does not find the cookie, it will not allow the loading of any fonts; therefore, you can still use your driver for non-text applications. For future reference, please be sure that the driver header begins on a word boundary for all drivers to be used with this version and any future versions of GDOS.

4) Vst_load_fonts() - We have made two optimizations to the loading of fonts. The first is when a load_font call is made, GDOS checks the date of the extend.sys file to see if it was modified since the last load. A reload used to be mandatory because a bigger scratch buffer might have been required. Since we no longer need a scratch buffer, GDOS only checks to see if a change has been made to the list.

The second change is that GDOS no longer deallocates the global list of fonts if there are no more workstations using GDOS fonts. Therefore, application launches will be faster. On the other hand, the miscellaneous cache never gets cleared of font header information, unless a reboot happens.

5) Memory.sys - The memory driver used to mistakenly open a printer handle.

6) vst_height() - Vst_height used to have a bug in which a maximum point size is reached and then the size begins to shrink. This is fixed.

7) Postscript table - The Postscript table has been fixed (i.e. the indexes were off by 32 for certain Postscript files).

8) Fixed vrt_copyfm() in the drivers.

9) When in 'bicsmode', character 0 was not passed through to the font engine.

10) Negative point and set sizes - The handling of negative point and set sizes has been made consistent with the original handling in FSMGDOS.

11) The handling of fractional setsizes was incorrect in the drivers, and is now fixed.

12) V_ftext() in the drivers can now handle the offsets passed into the ptsin array.

13) Screen drivers can now safely load as device 10.

14) The memory driver can be loaded residently.

15) vqt_devinfo() - Vqt_devinfo() now returns information, whether or not the device has been opened. Furthermore, the device drivers name, found in the driver header, is copied into the ptsout array; the name is 26 bytes long. Note: if the driver is not SpeedoGDOS-compatible, a null string is returned, and if there is an error, a -1 is returned in ptsout[1].

16) vst_width() - A new call has been added to Speedo. The call is similar to vst_height() except that it sets the width. The bindings are identical except that the opcode is 231. Note: As with vst_arbpt() and vst_setsize(), you must call the general call (i.e. vst_arbpt() or vst_height()) before using the width calls (i.e. vst_setsize() and vst_width()). In addition, the general calls always reset the widths.

Miscellaneous Note: Although these have been published before, many requests have come in for the SpeedoGDOS error codes. Here they are:
Code 1 Out of memory
2 File open
3 File read
4 File write
5 Speedo engine error
6 Character too large (not used, defaults to line output)
7 No room for scratch buffer
8 Character cache error
255 Miscellaneous
These errors are placed in the error code address that applications should provide. Note that if you have MultiTOS installed, GDOS will report the error to Salert, the system alert box. A revision of the error handling is overdue, since some of the errors are no longer relevant (e.g. code 6), and error code 5 is returned for the lack of availability for pair and track kerning (in addition to the serious errors).

11.9 COMPO

Compo offers a package of 40 Fontcuts in Bitstream Speedo-format (99.-DM, price may change): 4 Cuts of Bitstream Amerigo, 1 of Blippo, 1 Broadway,

1 Brush Script, 1 Caslon Openface, 1 Dom, 2 Kaufmann, 2 Ribbon, 14 of Swiss (Helvetica), 14 of Zurich (Univers)

11.10 IMG-0300

On the Internet:

ftp.uni-muenster.de /pub/atari/Gdos

11.11 Others

I am not choosing drivers to list here. I'll list them all! The authors and users of the programs should email me information about drivers they would like to see in the list. Please include code length, date, and known bugs.

11.11 FTP

Many students can get software worldwide via ftp (comment by s.d.: lucky boy'n girls ...). Prices for steady connections are constant, but connections between America and Europe have to be paid depending to the volume of data transferred.

Please try not to ftp over the Atlantic and use short ways.
Do your tranfers during off hours of the server (not 9am - 5pm).

Files with known names can be found by Archie.

In Germany:
telnet archie.th-darmstadt.de
login: archie
help

In the US e.g.:
archie.ans.net

The Archie databases ask about once each month one ftp server after the other for freely available files

12 Source

Being a developer it's possible to get an almost complete printer driver in object code. This one should only be fitted to a special printer.

This package is available for GDOS and SpeedoGDOS.

13 Tips'n tricks

13.1 Pixeltrash at printing, advice for users

Printing graphics on a NEC P6+ (maybe other printers too) including a lot of black in a line I often had the problem that one line was left out (Speedo drivers NB15, NECP) or two lines were printed displaced in one line (Speedo drivers FX80, NX1000).

This happens when printing directly and via CENSPEED. When using VARSPOOL this effect no longer occurs.

VARSPOOL can be found on the driver disk of the NEC-printers.

13.2 NEC P6+

Once in a while a NEC P6+ will get noisy (rrrrrrrrrrraattatatattaa).
When you open the front you'll see a round stick (about 1cm thick).
Put two drops of sewing-machine-oil on it each year (you'll get it from Mom)

14 Tips'n tricks for coders

Fontsize and Pixelsize

Here are my experiences with GDOS and WYSIWYG. Credits to Ulrich Rossgoderer for confirming these.

It's about the output of vector graphics and text on screen and printer.

The size of text is defined in point and is always the same - independent from the resolution of the output device.
Different are vector graphics: they have to be recalculated in pixels before the output. This should be no problem because when opening a virtual/physical workstation you get the pixel size in micrometers in devParm[3] and devParm[4].

Let's assume the vector graphic is saved internally in micrometers, then the definition points at the output simply have to be divided by devParm[3] or devParm[4] to get the position in pixels. When doing the output in windows an offset has to be added. But thats not relevant here.

So far for the theory being quite simple (see [3]).
Now for the practice.

As described above we output a text and a border - saved internally as vector graphic. It doesn't matter here if the text is a Speedo or a bitmap font.
To have a better chance to compare the border exactly surrounds the text.

Doing this I got the following experineces: The text exactly filling the border on the screen (ST-high) is - when printed - much too small compared to the border.

An error in the recalculation of the pixelsize can't be the problem, because I made the printing with the drivers NB15, NECP, FX80, NX1000 and the results are the same.

I have only one explanation for this: The screen driver supposes a different resolution for the pixelsize than for the font size.

Two solutions I can offer:

First you can use another pixelsize on the screen than the one given from the operating system. After opening the virtual workstation (and ONLY this one!) I claculated
devParm[3] := 282
devParm[4] := 282

and with this parameter I made the recalculation from micrometers in pixels.
Now the relation from graphic to text on screen and print-out is exactly the
same. But now a DIN A4-page doesn't fit on the screen in it's width.
The numbers are found by me the experimental way and possibly can be optimized

Another solution may be this: Use a smaller font size for the screen (and ONLY
there!) by multiplicating the size with 72/96. This is simple with Speedo fonts
because the size in points can be defined by almost endless values behind the
point. Using bitmap fonts this won't work due to not having a font in a
72/96 times size for every printer font. (Different to translate this, sorry - SD)

This method surely is to be modified for ST-Mid and other resolutions.

From Wilfried Behne (Half NVDI ...): SpeedoGDOS ignores the devParm[3]
and [4] - values of the screen drivers. The values of physical workstations
ARE taken.

15 Addresses

(Lot's of stuff is available from the friendly Atari-dealer 'around the
corner ;-/)

16 Miscellaneous

16.1 Critics

16.1.1 Critics to the author

Critics are greatly welcomed. To get more info, send email to:

G.CASTAN@physik.uni-stuttgart.de

Possibly one writing me has already tested two or three drivers.
Please write me if the errors listed above occured or not.

Anybody knwoing different driver support addresses, please write me an email.

16.1.2 Critics to the translator

Hi, this is Stefan writing :-)
The reason why I wrote this translation I can't find in my head ...

Guess it's because Atarians should work together and support each other!
Well, if you wonder about some errors of spelling or syntax remind this:
I learnt English at school for 4 years an after that I kept my knowledge
actual by playing some textadventures and now by reading
comp.sys.atari.st and comp.sys.atari.st.tech :-)
If you find some errors in this translation, please don't send them to Gerd but
to me:

stefan_damerau@sl.maus.de

But take care of the gateway-rules:
No mails bigger than 16kB and please no big UUE-stuff :-)

Thank you and have fun and lot's of experience with this FAQ.

Bye
Stefan

16.2 Praise

If this FAQ helped you out of a problem, please write me a postcard in your
next holidays.

Postcard received yet: not even one :-(

16.3 For my support

Due to actual experiences I ask the distributors to switch on verify when
copying update disks.

I only know two distributors not making any problem with this.

Could One of the readers try to write a Speedo fonte ditor? We (Gerd & Stefan)
offer our time to beta test it ;-)
[I remember that this sentence was slightly different before Stefan
translated it - Gerd]

16.4 Trademarks

This document is full of trademarks, no to be used free|y.

16.5 Guarantee

I'll offer no guarantee.

From: petep@info.isbiel.ch
Message-ID: <2nbehk$o45@vega.info.isbiel.ch>
Source record: 190186

i'm writing an application for GEM (with PureC and RCS 2.9). For that i need dialogboxes which stay on the screen (in german: "modale dialoge"), p.ex. like the dialogs in papyrus,winrec,...

can someone give me an example (if possible in c) or point me a magazine/book about that?

please post to this group or e-mail me: petep@info.isbiel.ch

thanks!

>showing this (for Pure C), you can send the message to me on:
>Olov_Johansson@p4.stacken.ct.se

There are a couple of ways of doing this, the easiest is to write a small program
that takes a binary file and generates C source code for an array that duplicates
that file.

Here's an off-the-top-of-my-head example, you'll need to stuff around a bit
with it, coz I usually use gcc, and I'm not testing this as I go.

```
FILE *in,*out; /* input and output files */
char buf[1024];
int buflen = sizeof(buf),
bufp;

in = fopen("input.fil","rb"); /* open input file (binary) */
out = fopen("output.c","w"); /* open output file (text) */
fputs("char fileguts[] =\n",out); /* write array definition */

while(buflen==sizeof(buf)) /* while data to read */
{
buflen = fread(buf,1,sizeof(buf),in); /* get a bufferful */
for (bufp = 0; bufp < buflen; bufp++)
fprintf(out,"%d,\n",(int)buf[bufp]); /* write one byte worth */
}

fputs("0 };",out); /* terminate array */
```

In reality, you'd probably write this as a function, and call it several
times with "a" rather than "w" in the second fopen(), and pass it some
parameters giving the file and array names.

Then all you need is a prototype like :

extern char fileguts[]; in your program, and you can access it as a preloaded
array.

Bear in mind that the .c file this generates will be _big_. (about 4.5 times
the size of your input file), but the .o file that PC produces will probably

not be more than a hundred or so bytes larger, and all of that is information for the linker.

Note also that this technique (as you have probably noticed) adds an extra byte to the end of the array. Occasionally that can be a _real_ nuisance (like when you have lots of word-aligned data - you can either add _two_ zeros, or go for a slightly more sophisticated approach, which I'll leave to you 8)

Best of luck!

Fortunately ASV was release 4 system V, i.e. although the last (final)
release is more than two years old it's quite up to date. You can get GCC 2.5.8
and X11R5 compiled on it and update the final release this way.

5887. New Atari Newsgroup (announce?)

Newsgroup: comp.sys.atari.st
Date: 1994-03-30 11:42:29 UTC
From: Lexicor@world.std.com
Message-ID: <CnH76u.2C9@world.std.com>
Source record: 190193

Hi,

not too long ago there was some discussion about splitting up the group possibly to 68030 and 68000 or to make new TOS newsgroup alternatives. However I am wondering if anyone of you are interested in creating a

comp.sys.atari.st.announce or maybe just plainly comp.sys.atari.announce

whichever..may as well stick to the st notation...(?)

The reason why I ask this is as follows, though there are quite a few new things released for the Atari concerning also commercial produce, very often so people do not like it...i.e. it is often frowned upon when people do press releases into a public newsgroup. This is why very often computer newsgroup have posted an announce newsgroup...so that people are more free to announce new stuff...basically invited to, and I think it is beneficial to both vendor and/or user. Also, he can of course choose not to read it...:) nothing unusual

Discussion would then be continued in this newsgroup if it was about an announcement..the announcement would be solely used for pure and simple announcing of any product related atari computers (or clones).

Watch'a all think?

Yat

5892. HELP! Directory deleted ! *&^$

Newsgroup: comp.sys.atari.st
Date: 1994-03-30 12:58:00 UTC
From: hjv@phil.ruu.nl
Message-ID: <2nbt0p$l4i@chico.staf.phil.ruu.nl>
Source record: 190198

Yeah, well, the subjectline sez it all in fact...
I had been working on a programming project for 2 weeks, when suddenly
a nameless file appeared (just a bunch of blanks as filename). Upon
inspection this appeared to be a copy of one of my sourcefiles, so I
thought I might as well delete it.
Dragged the thing to the trashcan -- and the machine starts deleting
the COMPLETE directory !!! *&$^^#
Problems:
1. Two weeks of work is gone (no, I didn't have a backup -- flame me)
2. Both FAT's are not identical
3. The files weren't contiguous

Solution:
Ask you guys out there what I should do...
Is there a good undelete-program -- preferably one that is able to track down
non-contiguous deleted files, and one that lets you save the undeleted file
on _another_ partition (just for safety)? Preferably PD/shareware/freeware.
Any suggestions, hints, tips and tricks?
I'm really desperate so *any* reaction or suggestion is more than welcome.

Email and follow-up are both ok with me...

Geesh, there are days when I simply *hate* those machines...

P.S. does anybody have any idea as to what *caused* the problem in the first
place? I've never seen anything like this...

Thanks in advance for any and all help.

Hendrik Jan

>in GFA BASIC)

The binaries to MiNT 0.95 (and 0.96?) are available from various
FTP sites. As for the binaries that are *not* distributable...

>Is this no-binary thing just because the version is new, or have I mis-
>understood something, or what?

Versions of MiNT 1.00 or newer (basically, any of them developed
after Atari bought the rights to it) can only be distributed in
source code form only. I think the basic premise is that since
they are released in source code only, you are undertaking the
"risk" to compile and use what is essentially beta-version software,
and it does kinda make sense that Atari shouldn't be "supporting"
(via help line or whatever) versions of software that are not
commercially released as of yet.

The fact that Atari is even allowing the source code to be distributed
is a commendable thing, however - I can't see Microsoft releasing
Windows code or Apple releasing System software code. It helps
Atari in that almost anyone with the source could always help as
far as bug reports, etc. And, well it gives me something to
do with GCC :-)

5895. QUES: FontGDOS and also about Atari Works

Newsgroup: comp.sys.atari.st
Date: 1994-03-30 13:59:05 UTC
From: bobhays@spss.com
Message-ID: <bobhays-300394075905@haysmac.spss.com>
Source record: 190200

Two questions (one with subs):

1) Has anyone gotten the fsmprint.acc accessory from fontgdos to work? I'm using it with a BJ10 driver and I cannot get the accessory to provide a menu entry. I've pulled the zoo file (or was it lzh) from a umich mirror.

2) Does SpeedoGDOS come with AtariWorks? Does it have a BJ10 or 10E driver included? I have TOS 1.0 (yea, an old machine:-) - other than black page, any problems I should worry about? Any tools from the net I should grab to use AtariWorks?

Thanks and have fun! - Bob

P.S. Email is fine by me - I think lots of these questions have been asked before here, but unfortunately at the time I didn't need answers:-). And, I don't know where to find a current FAQ for this group. - RLH

Source record: 190064

From my conversations with people in the know I don't believe the computers are over and done with, but Atari needs continued financial support and good press. The way they are getting people to take them seriously is by saying that the computers are gone. That's what the analysts want to hear, so Atari says that and gets good press. What would have happened to their stock if that article had read "Atari continues to lose money do to poor computer sales in Europe and hopes to prop the line up with profits from the Jaguar". I believe you could kiss them goodbye if anything like that was said.

They haven't quit making the Falcon and as far as advertising them, they are doing just as well as they have for years...

IMHO

>doesn't multitask and doesn't poll during program execution.

The problem with your argument is that most of it is based upon a currently vaporware version of MultiTOS. Whether MultiTOS is an emerging OS will depend upon 1) whether Atari starts selling more computers, 2) whether Atari decides to remain in the computer business, 3) if Atari shuts down their computer operations they let their current developers (eg. Eric Smith) continue to develop TOS/MultiTOS independently, and 4) if they allow 3), these developers feel there is a market worthwhile to put the effort into it.

az>>-Anyone heard about a 8MB RAM-board for the Falcon?

az>- dont see why not, so long as you have drivers. after all, it IS
az>SCSI

My worry is about the pc-compatibility of the connection between
pc-emulator and the scsi-bus. But the point about drivers is taken.
Does anyone have any experience with this (the combination
falcon+pc-emulator+cdrom-drive+pc-cdrom-discs)?

az>- what about the Falcon memory board from Toad? I put 16mb in
az>mine, but see no reason why you just cant put two 4mb SIMMs

There is a technical reason why the falcon works only with 1, 4 or 16
MB. All 3rd-party ram-boards known to me only support these. If the
toadboard works with 8MB, this would be unique.
Actually, I would like to ask if you could try this.
Thanx in advance.

That is why we need to have a well written set of instructions for compiling MiNT. Or, better yet, distribute a package that includes enough files and compiler resources to compile MiNT. The package would need a program that invokes the compiler and compile the correct objects.

>I've been compiling MiNT with GCC 2.3.3 with PL3X libraries. I don't think
>this gives a particularly small binary, but it seems to work very well.

Has anyone except Eric used any other compiler to create MiNT?

5926. Re: ATARI FLOPPIES: READA

Newsgroup: comp.sys.atari.st
Date: 1994-03-30 20:41:16 UTC
From: L676791@LMSC5.IS.LMSC.LOCKHEED.COM
Message-ID: <16F89B270S86.L676791@LMSC5.IS.LMSC.LOCKHEED.COM>
Source record: 190081

Having followed this thread for about a week, I have done some experimentation, and have found the following to be true:
(BTW, I own a Mega STe w/4MB RAM, 50BM HD, 1.44 MB internal floppy, 750K external floppy - the Mac at work I use a Mac IIci w/20MB RAM, 160 MB HD, and 1.44MB floppy.):
1. The Mac will NOT read Atari formatted disks with Apple File Exchange version 7.0. Apple File Exchange can format floppy disks to PC format. Disks formatted this way CAN be read by the Atari. I can copy ASCII text files from the Atari onto the PC formatted disks, and the Mac can convert them using Apple File Exchange - although all formatting is lost and some wierd characters appear which need to be deleted.
2. Atari can emulate a Mac using Spectre GCR. It can operate most Mac software, and can read and write Mac disks. WARNING - I find Spectre GCR to be very buggy on my system. While there are many satisfied users, there are also MANY people who have problems with it. Be forwarned that there is absolutely NO customer support by its manufacturer, Gadgets by Small.
3. Atari can read and write PC formatted disks - no problemo. PC's can read Atari text files saved in ASCII format.

Source record: 190084

BTW, I forgot to mention one other way to transfer files from a Mac to Atari: something called MacSee. This will convert text from Atari to Mac, and vice versa. VERY buggy, and sometimes the text files are unusable.

That violates the spirit (although not the letter) of the license agreement.
But in any case, it's not really hard to do. Just set up the compiler and
'make'. I pretty much agree that if you can't do that, you needn't worry about
using MiNT by itself anyway. Get MultiTOS or one of it's competitors...

Later,
Steven

>getting up at 6am just to here a recorded message.

No, I'm not "Wrong again"

10am in IL,USA is 4am NZST , 4am is economy.
(Note:I think they switch into DST at 1am this Sunday, so that will
make 10am there 5am here)

Ecomony is 10pm to 8am, so if you called just before 8am, it would be
just before 2pm there (3pm next week).

When you called at 6am, it would have been 12pm there... maybe they
all went off to lunch and left an answering machine on??? Try ringing
a bit earlier or later.
Oh, and don't bother calling on a Monday, it's Sunday there.

>By the way you prices don't include GST, gee were did you go to school..???

I went to school here in Christchurch, New Zealand.... I guess they
taught you differently in the uk? Assuming that's where you're from?

I'll Quote from the Clear Residential rates book.... "International
rates are quoted in dollars per minute (GST inclusive).

And in the Telecom rates book, it's got 2 columns , one says GST Incl, the
other GST Excl, I quoted the rates from the GST Incl column.

>Plus there is no Clear here on the Gold Coast....

So you're paying 1 or 2 cents a minute more through Telecom... no great loss.

Craig.

> the following questions:

> 1. Is the Mega keyboard a "decent" keyboard (solid key contact, good
> tactile feedback)?

No. It is better than the 1040 keyboards (my opinion), but the keycaps
are too big at the top (i.e. there is less taper to the keycaps when viewed
from the side). This means that there is very little space between the keys,
which contributes to more typos. The feel of the keys are OK, but the poor
keycap design is quite irritating.

> 2. What should I expect to pay for one?

> 3. Where's the best place to get one?

> Your opinions, please....

IMHO, the best Atari keyboard is the MegaSTE/TT unit. It has joystick/mouse
ports on the side (not under, like the Mega), modern tapered keycaps, and
real function keys. It uses the round rubber thingies underneath the keys,
so the feel is a bit mushy, but other than that it is great. I have been
told that it is completely interchangeable with the Mega keyboard, so your
mod should still work.

However, there is likely an even better solution for you. Try to find a
DEKA keyboard unit. It is a hardware interface that allows you to hook up
any PC compatible keyboard to the ST (I know it works for Mega's, and I'm
pretty sure there is a way to use it with 1040's). You can then get a nice

microswitch PC keyboard and wail away. It is totally hardware based, so you should not have any weird compatibility problems (I have seen units that require a software driver, which will obviously not work with bootable games).

As for sources, I have seen a couple for sale on the net recently. Also, try D&P Computer Supply (1-800-535-4290) and Toad (1-800-448-TOAD). The unit was less than $100.

Hope that helps.

I _knew_ there would be a follow-up of this nature. When/if Atari decides to release this version publically (i.e. _anyone_ can go out and buy it, not just registered developers), then it will _not_ be vaporware. Atari has developed products in the past that were never publically released and historically they have been classified as vaporware in this newsgroup.

If you use the Selectric item selector, you can pass more than more file
back to Connect (it is some new extended specification). Other than that,
I don't think you can do it with Connect's internal Zmodem. Selectric
(English version) is available from atari.archive.umich.edu.

5937. Problems with PATCH

Newsgroup: comp.sys.atari.st
Date: 1994-03-31 00:22:30 UTC
From: rgivan@cix.compulink.co.uk
Message-ID: <CnI6DI.A4t@cix.compulink.co.uk>
Source record: 190093

I am trying to patch a copy of the MiNT 1.10 sources with the MiNT-NET patches but am getting nowhere fast.

I'm using MiNT 1.08 and the KSH shell. I also haven't figured out UNIXMODE yet. Do I need it - and if so what *should* it be set too? I've tried:

export UNIXMODE=._

but this doesn't help :-(

Patch seems to have problems backing up files and therefore starts using tmp. Unfortunatly it always uses the *same* name in tmp for any one session! Also the problem files dissapear after patch has been at them.

:-(

Roland

5939. MEGA ST UPGRADE

Newsgroup: comp.sys.atari.st
Date: 1994-03-31 02:04:24 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <2ndb38$nvu@golem.wcc.govt.nz>
Source record: 190095
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well at last I have a upgraded Mega ST 2...

I brought the Mega just befor Xmas as I wanted a machine
with Overscan and a Built in Hard Drive, Falcons/Mega ST
and TT are far to dear here...

I had all ready ordered the ADspeed and Micro Host adapters
made by ICD from a friend, he was send a flyer stating
that these were on sale, $39us for the Micro Host and
$99 for the ST ADspeed..

They took a bit of time to get here, but then I did not have
my Mega yet..

Well I did not fully test the Mega, it looked OK and when I run it..

Well as soon as I recieved the these upgraded bit I fitted them
all to the Mega, the Overscan was the only problem, were to fit it,
well I found a place just above the CPU, also the ADspedd cut trace link
that was mentioned for the blitter patch was not needed, the 68000 CPU
had the IC leg lifted out from the PCB...

I did a small mod, to the PSU as the 5 volts was low, no adjustment on this
version, its set by 2 fixed resitors, so I just shunted one to bring it
up to 5 volts...

Well after it was all together it seem to run for 8 hours them crash on me,
the Neodesk could not find its resource file,?? I would copy a new one and all
would run again till I rebooted..??

Well it finally gave up, so out came the ADspeed and the Hard Drive, patched
out the Overscan mod also the New TOS 1.04 Roms that I had fitted, still no
joy.

Well out came my trusted 1740A HP scope, and found a short in one of the Ram
chips, as I could not get Nmos Rams any more I replaced it with a Cmos one,
this was then tested for a day with the Supra memory test program, all was
ok..!

Replaced the ADspeed, but that would fail after 8 mins, this was finally
returned to ICD, a replacement came back after a 2 months delay..

Every thing was reassembled, and has now been working for some 4 days now,
the only other problem is the ADSPEED.PRG, it looks like it has some Bugs,
this has been mentioned by ICD, TEMPUS II will crash after 20 seconds..

The ADspeed is very nice and well made product and so is the Micro Host adapter, its a pitty that they are no longer made, but I think they still have stock left..

So why not give that old Mega a new lease on life and fit these upgrades, well worth it..

If any one needs any help about these upgrades Please E-Mail me....

PS. The ST_FORMAT free copy of Arabesque Pro does not like Overscan, but that was version 2.14 and I know there is a later version 2.15....

5941. Storm...lzh files, etc...

Newsgroup: comp.sys.atari.st
Date: 1994-03-31 02:18:39 UTC
From: andelain@xmission.com
Message-ID: <2ndbtv$n41@xmission.xmission.com>
Source record: 190097

Hi.

First off...
I have a 520ST, expanded to 1040...a couple of floppies and a 20 meg hd.
I am using storm for telecomm, and am getting _very_ frustrated at the
terminal emulation.

Ok..to the point...
I understand there are/is a patch which is supposed to make the vt100
emulator act a bit more like a vt100. Is that patch the storm02.lzh (approx)
file on wuarchive? Also, there was a posting a while ago which said to
"apply the patches in order..." or something to that effect..

So, all this leads me to the following questions:
1. How do I 'uncompress'? the lzh files and make them 'usable'?
2. How do I 'apply' patches?
3. Is there such a thing as a Jpeg/Gif viewer available?
4. Is there a 'computer idiot' PPP/SLIP program available?

That should take care of todays questions...Thanks in advance to whomever
takes the time to help me out. I'm obviously not a programmer, so I could
use "do this, then, push that button" type instructions. :)

So long!

Fair enough, I just thought the term vaporware meant that it didn't even exist. Mag!x does exist and manages to provide pre-emptive multi-tasking without the speed penalty. In fact some functions are faster than TOS.

IS anybody using this combination successfully? The Assigner program doesn't like the idea that there aren't any fonts in the Assign.sys, but the Fontwid program finds all of the fonts that I have selected, I have had the font tables on/off, but I can't get it to accept graphics wth the spacing option in the graph... Which then won't allow me to print...

Any suggestions? I am not using ANY of the Bitmap fonts, just what the Extend.sys contains...

you can get hermes 1.10 from a varity of FTP sites in europe or if you don't
have FTP, you can grab it by mail from my server here at harvee. send the
message:

dir
help

to server@harvee.billerica.ma.us and you will get instructions on how to
grab hermes 1.10 and a tiny tar program to unbundle it.

Hi: in a fit of sentimentality i hauled out the old 1040 st yesterday, and now remember a demo of a game i had for it 6-7 years ago, and am wondering if anyone remembers it.

the game was a scrolling landscape game like xevious, it would only scroll up and down. the backgrounds were extremely well drawn, in particular there was one level (colored shades of green, if i remember) that had skulls and other death insignia...there was a somewhat playable demo version of the game floating around.

i seem to remember that the game was called star runner, or something like that. it would have been 6-7 years ago. can anyone help me with this?

thanx

- bill

In the U.S.A., copyrights cannot be held for longer than something like
75 years. Dickens and Descartes have both been dead at least that long.
Dickens's works are available from multiple publishers, and any copyright
notice you may find in a recent printing covers only whatever exists other
than the text of the novel---the cover artwork, maybe. Whatever implicit
copyright the Iroquois Constitution might have had must have expired by now,
too. I assume a similar reality holds for other nations' copyright laws.

(Can't speak for the CIA Factbook or Princess of Mars story.)

Hello(again),

I would like to thank everyone for the names of the offline newsreaders
and I have found one of them, HERMES, but it is an older
beta version that I found on umich. I am going to try to
look at it, but have found a major stumbling block, it is is a
1.5 meg *.tar file. What the heck do I do with that??

Also, if anyone knows where version 1.10 is, or where UUCP point
is located(as well as the current version), that would be great.

I do have the address of someones machine where HERMES v1.10 is
located, but I have yet to figure out how to 'mail order' something
from his machine, even with instructions, and I did not write down
his address. So, if you are out there, please send me a
simple and easy explication of how to get the file.

Thanks,

joseph

You need a program called lharc or similar. v2.99 is available which is
quite simple to use and is found on most BBSs and ftp sites.

>3. Is there such a thing as a Jpeg/Gif viewer available?

There are several. GEMView is one. You will need to browse around for
others. For GIF you might like to give Speed of Light a try.

The game I remember was called Gold Runner. The versions that
floated around was the cracked version from the Amiga systems.

It was crack by Dr. Frankenstein, from the old Dark Star BBS.

I use to have it but it wouldn't play on my new machine.

[...stuff deleted...]

Roger, you will find that many older programs do not work with Overscan r
ADspeed. Many programs assume a fixed screen size and others (Tempus) rely
on the CPU timing for some operation (some blitting in Tempus, but I'm not
sure). These are all bad practices, but were common to optimise speed.

You can change the ADSpeed frequency by poking the registers:

```
-------+-----+-----------------------------------------------------+----------
###############ADSPEED Configuration registers ###########
-------+-----+-----------------------------------------------------+----------
$F00000|byte |Switch to 16 Mhz |W
$F10000|byte |Switch to 8 Mhz |W
$F20000|byte |Turn on high speed ROM option in 16 Mhz |W
$F30000|byte |Turn off high speed ROM option |W
$F40000|byte |Unknown |W
$F50000|byte |Turn off cache while in 16 Mhz |W
| | >> Write 0 to an address to set it. << |
```

[About Multi-TOS...]
>It is NOT a vaporware version. It exists and works. It's available to all
>registered developers.

I hate to step into a conversation about something I know very little,
but isn't the above description by Ofir of MTOS _also_ an accurate
description of ASV (Atari System V [Unix?]) shortly before it became
permanently unreleased?

On a (semi-)related note, would you, Ofir (or anyone who cares to give an
opinion! :-), say that MultiTOS is the best choice for someone like myself
wh owould like to be able to multi-task, but whose main computer use is
application running, very (_very_) occasion programming for fun only, as
well as the occasional round of NetHack (and a few other games)?

Thanks for the input ahead of time!

-Matt

P.S. What, and why is Minix?

P.P.S. What has Minix to do with the speed of MultiTOS (or anything else,
I guess)?

>Is this no-binary thing just because the version is new, or have I mis-
>understood something, or what?
>--

Any MiNT version above 0.95 (or possibly 0.96) is distributed as C
source code, and binaries are not allowed to be exchanged. I used MiNT
0.95 for a long time though and it seems pretty stable. I've now used
Lattice to compile MiNT 1.08, and I'm about to apply patches to take
it to 1.09, which brings me to another question: Is there any (real)
support for Lattice yet? (ie MiNTlib binaries, Lattice specific source
etc.)

That's *inclusive* of a harddisk? Over here in the Netherlands,
Falcons 4/84 are being sold for DFl 1999,-, approx. $1150,-, or &575,-

Still, with a decent monitor, BlowUP and NVDI you'd still be about
$1715 lighter...

|> but this doesn't help :-(

You should either leave it unset or set it to "/rU", where "/" means
"translate / to \" and "rU" means "use drive U: as root drive".
Another switch that may be interresting is "s", meaning "emulate
interpretable scripts", i.e. files having something like #!/bin/sh in
the first line. Unknown switches like ".X", which is only meaningfull
with bammi's GCClib, will be ignored by the MiNTlibs.

On the contrary! Maybe the Tramiels's weasely penny-pinching is why
Atari Corp. is still around and Commodore is going down the tubes???
After Tramiel left Commodore, Commodore spent A LOT of money on A LOT
of things (the $15 million Amiga TV ad campaign that failed, for one!).
Perhaps the Tramiels being tightwads IS a good thing??? <grin>

Personally, and from what I've heard people in the industry say, I
Commodore's more likely to go into liquidation than be restructured.
It's a shame, though, because (all advocacy aside) the Amiga is a
great little machine -- maybe in the liquidation, the Amiga design
will be sold off to someone who will continue developing and supporting
it???

I guess he meant "virtually vaporware." That is, until the actual buying public can purchase it, it's vaporware for all intensive purposes. As an example, the old Atari 1450XLD - it was developed but was never sold as a product (there may be a few floating around out there, but they were essentially "vaporized").

Personally, I hope Atari continues work on MultiTOS - it's a reasonable start into the world of multitasking. (has anyone here ever played with an old version of Windows? I'm talking 1.0 or even 2.0. They were still light years away from the current version as far as power, capability, etc).

Assuming Atari (and Eric!) continues development on MTOS, they could do some really nice things with it...

>using MiNT by itself anyway. Get MultiTOS or one of it's competitors...

If Atari would update MTOS we wouldn't have a problem - but as the current
release version is over a year old - more and more people are finding the
need to brew their own MiNT/MTOS kernels.

ALthough I have the facilities to recompile MiNT (*), many people don't have
the equipment. Its a pity they are restricted from using later versions
of MiNT though.

(*) And own a copy of MTOS.

BAD NEWS! Although the Falcon has 4 stereo channels to play around with, only
ONE channel can currently connect with the output at any time!!! So, if you
want to get more than one channel, then you'll have to mix the samples in
software. (Yet another use for the DSP again!) Shame, really.

Michael.

>Hi does any one know how to upload a Text file to GEnie,
>with out using Aladdin, (would take me weeks to work out how to use it),
>with out loosing the Format of the letter..

Do you mean as if it were entered by hand? (like say, "uploading" a text file in a RTC, as a message in the BB section, etc?). The basic way is to use (assuming the term supports it) "ASCII UPLOAD." Most terms (like CoNnect ;-) have this option...

Or you could use something like EDHAK, which has an "upload" feature to upload a block of text (or the whole buffer) to the serial port. I use Edhak in just this way when there's an "official" RTC going on. I type my question into Edhak ahead of time, mark the text (if I have multiple questions), and when it's my turn to ask, I simply upload the chosen text.

The Edhak "demo" version (available FTP, etc) limits you to a 2k buffer, but for messages, etc this should not pose a problem. Besides, Edhak is worth the registration IMHO...

This should work as well for the BB message areas (since Genie is kinda slow, it may look a little funky while entering the message editor on GEnie, but should be ok - you might try a test message there to see how it handles it)...

Hope this helps...

One possibility to waste less money on the bank is to make a joint contribution
from several people in your country at once. This way, you pay less overhead
and also make it easiser for the receiver to cash the money. I've done this
myself on several occasions with good result.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have been experimenting with Mint on my stock MEGA-2 ST (not STe) and
have come to the conclusion that I need more memory and speed, so I need
answers to the following. BTW - I am using TOS 1.04

1. What is the easiest and safest DIY (Do It Yourself) method of upgrading
to 4 meg of RAM? Could someone please send me the specifics including
a source for the chips?

2. What options do I have for increasing processor speed? I am running at
8 MHz with a 68000 CPU. Compatability with older programs like Flash
and WordPerfect is important as well as MIDI programs (I use SmpteTrack
which is suppossed recognize faster clocks, but other progs might not.)
Something that has a physical switch for the clocks would be ideal.

If you have any information that might help me, please send email to:

vcross@genie.geis.com
(the bnr.ca address will bounce, so don't mail me there)

Thanks,
Vince

It SHOULD be a simple matter of adding 16 1M_BIT_ DRAMs (not 128kBYTE)

that's all I know...

Steve> aside) the Amiga is a great little machine -- maybe in the
Steve> liquidation, the Amiga design will be sold off to someone who
Steve> will continue developing and supporting it???

I have to agree... Though the Amiga is the only platform I DON'T
have, and being an ST user I'm supposed to hate Amigas, it would
really be a shame to see them go away...

I don't think it'll happen, though. C=, IMHO, will stay in the
business of making Amigas. And if they don't, as you pointed out,
SOMEone will take over the Amiga. Maybe ICD? *grin*

As for Atari leaving computers behind, I'll believe it when I see it.
Despite user gripes, Atari DOES seem committed to the computer line...
And if they DO leave them behind, we'll still have the clones, the
Codeheads, Gribnif, etc... Atari is in no way a dead end!

>Where can I get logo?

Logo came with the first ST's on the language disk. It never became very popular unfortunately, so it was never upgraded. Digital Research, who wrote the language did some weird things with the file selector, and that is where things went wrong when I installed TOS 1.4. I didn't have any time yet to check for a possible fix.

>come out on top and I'll be happier!

I don't think anyone has ever compiled MiNT using Sozobon C. I do remember
Scott Bigham was considering compiling MiNT with Heat 'n Serve C, but a lot of
work is needed because the assembler (jas) that comes with Sozobon does not
offer all the necessary features.

(BTW, Sozobon C/Heat 'n Serve C produce some quite good code, provided that you
run the optimizer)

From: sang@tss.com
Message-ID: <2nf7c8$u1@newsflash.tss.com>
Source record: 190050

Hi all,

Anyone out there has documentation of the Atari ST's
(520 and so on) vector table? I believe that there
are 256 vectors. These vectors include trap vectors.
But the Atari ST computerS do not use all of them.
If you post a list of this vectors and which ones
being used by ST computers, that would be greatly
appreciated.

Many thanks.

Sang.

I also would like to see this. Many times people are asking
questions about new products and the e-mail addresses of the
companies producing them. It'd be great if there was a section
for that. After all, almost every Atari developer in the States
is on GEnie and, therefore, has internet access.

I am probably on the wrong news group, but since no one on the mac news groups would respond, I am asking here.

Does anyone know if there is an Atari ST or TT(it has been a while since I have dabbled in the atari field) emulator for the macintosh? Because of work, school, etc, I got a mac and I would like to emulate an ST on it. If it is possible email me or post to this newsgroup. I will check it out. Any help would be appreciated.

Thanx
Anthony

I hope Atari will release a new version of MTOS. It may be similar to ASV
but the difference is that MTOS is a released product that many people
bought - the distribution is handled by 3rd parties anyway - all Atari
need do is give them the go ahead.

>On a (semi-)related note, would you, Ofir (or anyone who cares to give an

Not that I understood much of this, although I'm assumming it's an ad for a collection of shareware, BUT the word XEDIT sure caught my eye. Would the author of this note or the product like to share (in English, if possible) some further info as to whether this editor is by chance a work-a-like to the XEDIT we all know and love from the VM mainframe world?

6008. MegaSTE GST Shifter markings (help)

Newsgroup: comp.sys.atari.st
Date: 1994-03-31 21:47:11 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2nfgcv$p6@mailer.fsu.edu>
Source record: 189863

In a previous post, I asked for folks to send me the markings on their GST Shifter chip (in MegaSTE's). I have received plenty of responses from folks who have the DMA sound problem like me (the replacement of the chip fixes this bug), but I have received only one response from someone who does _not_ have this problem. I really need to get a few more "good" chip markings, as the only place I have found that has them cannot distinguish the revisions of the chips (only revision D or later fixes the bug). Thus, I need to be able to say "OK, sell me a chip that has any of these markings: . . . ". At this point, all I can say is "Don't sell me any that have these markings: . . .", but this is not as good :-).

Thus, if you have a MegaSTE and you don't have the crackling DMA sound problem (there is an easy test listed below), _please_ send me the markings on your GST chip. You do not have to disassemble anything major to see it, just the plastic hard disk cover on the right-top of the machine (one screw). The original post with full instructions is below. I'll be posting a summary of all this chip stuff, so your efforts will benifit many (certainly the dozen or so that have emailed me with bad chip markings :-). I'll also include it in the MegaSTE FAQ that I am putting together.

Thanks in advance.

Original post follows:

It occurs to me that I have just about every Bitmap Brother's game there is. They are all excellent. The only one I can remember that I don't have is The Chaos Engine. Is it work getting? My guess would be yes, but it never hurts to check :-).

Here are the others that I know about:

Speedball (1 & 2) - awesome overhead football games, best for two players
Xenon (1 & 2) - vertical scroller third person shoot'em ups
Gods - sideview "jump and shoot things" game

Have I missed any? Any recommendations/good cheats?

There's your problem - your partitions probably have to be <16M for it
to work (ie you probably have 1K clusters there)

There is definetely a 2.0c as I used to have this. I have no idea how it would differ from your version.

Thanks - I've solved the problem now. I chnaged my 'patch.ttp' for another
and it patched first time! :-)

I've now managed to patch MiNT 1.10 so that MiNT-NET boots. Anybody else
figured out much beyond this? I can set up 'inetd' etc, but 'tftp' doesn't
seem to want to talk to my 'ka9q' setup on my other ST.

Thanks

Roland.

>bought - the distribution is handled by 3rd parties anyway - all Atari
>need do is give them the go ahead.

Two other points to note:

1) AFAIK Atari doesn't actually own the (c) to the AES. For everyone that is sold they pay a royalty to Digital Research. This seems to be the reason they don't distribute it in the same way as MiNT.

2) AES 4.1 is much easier to *pirate* than ASV! If Atari don't release it - it will only be a matter of time before those poeple who want it will have aquired it.

Note: I have *no* wish to pirate anything, but once a company stops updating a product - the remaining users seem to take it into their own hands, legally or otherwise.

Roland.
